

61A Lecture 30

Wednesday, November 12

Announcements

- Homework 8 due Wednesday 11/12 @ 11:59pm
- Project 4 due ~~Thursday~~ Friday 11/21 @ 11:59pm
 - Early submission point #1: Questions 1–6 by Friday 11/14 @ 11:59pm
 - Early submission point #2: Questions 1–16 by Tuesday 11/18 @ 11:59pm
 - Early submission point #3: Submit by Thursday 11/20 @ 11:59pm
- Homework 9 combined with Homework 10 (6 pts), due Wednesday 11/26 @ 11:59pm
- Guest lecture Friday 11/14 by Andrew Huang

Survey Results

- Midterm 2 was difficult and discouraging
- Too many adjacent deadlines
- Too hard to get help in office hours and homework/project parties
- Better guidance on how to solve problems
- Pace, information overload, and extra credit

Data Processing

Processing Sequential Data

Many data sets can be processed sequentially:

- The set of all Twitter posts
- Votes cast in an election
- Sensor readings of an airplane
- The positive integers: 1, 2, 3, ...

However, the **sequence interface** we used before does not always apply.

- A sequence has a finite, known length.
- A sequence allows element selection for any element.

Some important ideas in **big data processing**:

- Implicit representations of streams of sequential data
- Declarative programming languages to manipulate and transform data
- Distributed and parallel computing

Implicit Sequences

Implicit Sequences

An implicit sequence is a representation of sequential data that does not explicitly store each element

Example: The built-in **range** class represents consecutive integers

- The range is represented by two values: start and end
- The length and elements are computed on demand
- Constant space for arbitrarily long sequences

..., -5, -4, -3, **-2, -1, 0, 1, 2, 3, 4, 5, ...**

range(-2, 2)

(Demo)

Iterators

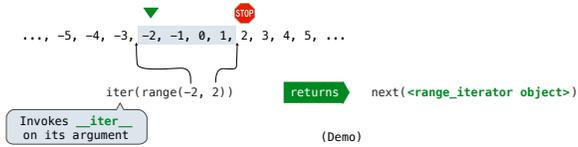

The Iterator Interface

An iterator is an object that can provide the next element of a sequence.

The `__next__` method of an iterator returns the next element.

The built-in `next` function invokes the `__next__` method on its argument.

If there is no next element, then the `__next__` method of an iterator should raise a `StopIteration` exception.

Iterable Objects

Iterables and Iterators

Iterator: Mutable object that tracks a position in a sequence, advancing on `__next__`

Iterable: Represents a sequence and returns a new iterator on `__iter__`

LetterIter is an iterator: LetterIter('a', 'e') ▼
LetterIter('a', 'e') ▼

Letters is iterable: Letters('a', 'e') 'a' 'b' 'c' 'd'

(Demo)

Built-in Iterators

Iterators from Built-in Functions

Many built-in Python sequence operations return iterators that compute results lazily

`map(func, iterable):` Iterate over `func(x)` for `x` in `iterable`
`filter(func, iterable):` Iterate over `x` in `iterable` if `func(x)`
`zip(first_iter, second_iter):` Iterate over co-indexed `(x, y)` pairs
`reversed(sequence):` Iterate over `x` in a sequence in reverse order

To view the results, place the resulting elements in a sequence

`list(iterable):` Create a list containing all `x` in `iterable`
`tuple(iterable):` Create a tuple containing all `x` in `iterable`
`sorted(iterable):` Create a sorted list containing `x` in `iterable`

(Demo)

For Statements

The For Statement

```
for <name> in <expression>:  
    <suite>
```

1. Evaluate the header `<expression>`, which yields an iterable object

2. For each element in that sequence, in order:

- A. Bind `<name>` to that element in the first frame of the current environment
- B. Execute the `<suite>`

When executing a `for` statement, `__iter__` returns an iterator and `__next__` provides each item:

```
>>> counts = [1, 2, 3]
>>> for item in counts:
>>>     print(item)
1
2
3

>>> counts = [1, 2, 3]
>>> items = counts.__iter__()
>>> try:
>>>     while True:
>>>         item = items.__next__()
>>>         print(item)
>>>     except StopIteration:
>>>         pass # Do nothing
1
2
3
```

Generator Functions

Generators and Generator Functions

A generator is an iterator, created by a *generator function*

A generator function is a function that yields values instead of returning them

A normal function returns once; a generator function yields multiple times

When a generator function is called, it returns a generator that iterates over yields

```
>>> def letters_generator(next_letter, end):
    while next_letter < end:
        yield next_letter
        next_letter = chr(ord(next_letter)+1)

>>> for letter in letters_generator('a', 'e'):
    print(letter)
a
b
c
d
```

(Demo)
