

Lists

['Demo']

Working with Lists	 	

>>> digits = [1, 8, 2, 8]

>>> digits = [2//2, 2+2+2+2, 2, 2*2*2]

The number of elements

-

```
>>> digits = [1, 8, 2, 8]
The number of elements
>>> len(digits)
4
```

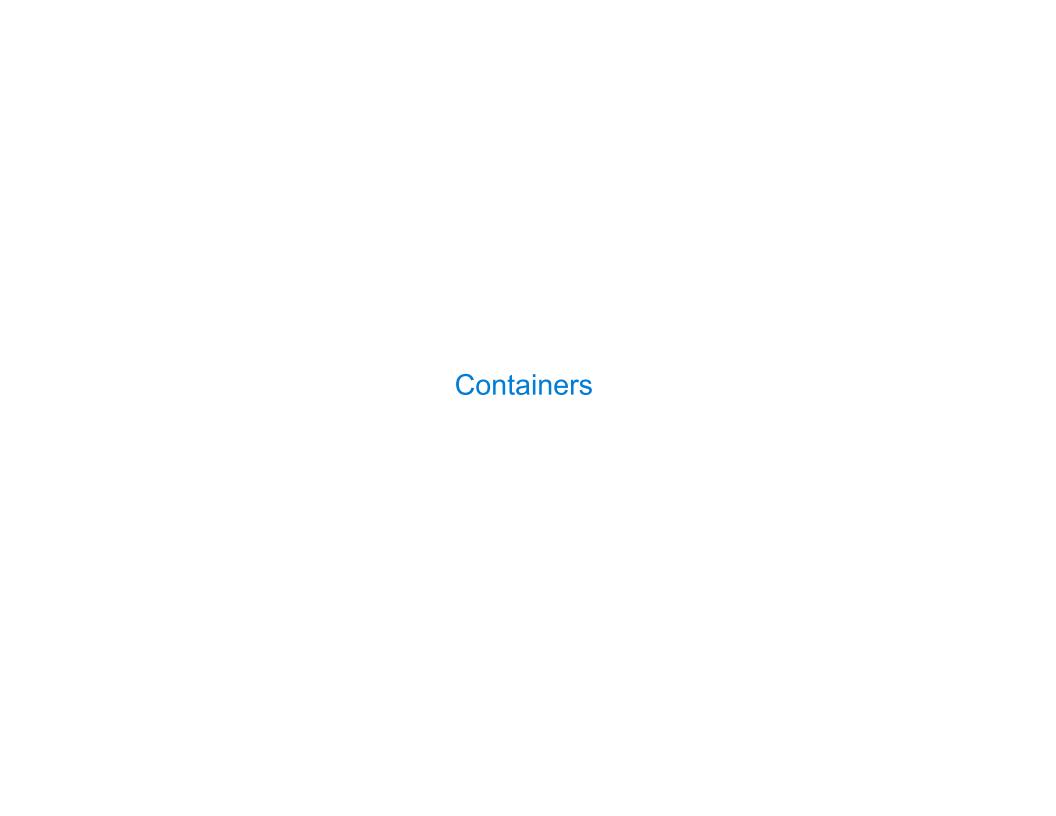

An element selected by its index

>>> digits = [2//2, 2+2+2+2, 2, 2*2*2]

.....

Nested lists

```
>>> digits = [1, 8, 2, 8]
                                          \Rightarrow digits = [2//2, 2+2+2+2, 2, 2*2*2]
The number of elements
   >>> len(digits)
An element selected by its index
   >>> digits[3]
                                          >>> getitem(digits, 3)
Concatenation and repetition
                           >>> add([2, 7], mul(digits, 2))
   >>> [2, 7] + digits * 2
    [2, 7, 1, 8, 2, 8, 1, 8, 2, 8]
                                         [2, 7, 1, 8, 2, 8, 1, 8, 2, 8]
Nested lists
   >>> pairs = [[10, 20], [30, 40]]
   >>> pairs[1]
   [30, 40]
   >>> pairs[1][0]
   30
```

Built-in operators for testing whether an element appears in a compound value

Built-in operators for testing whether an element appears in a compound value

Built-in operators for testing whether an element appears in a compound value

```
>>> digits = [1, 8, 2, 8]
>>> 1 in digits
True
```

Built-in operators for testing whether an element appears in a compound value

```
>>> digits = [1, 8, 2, 8]
>>> 1 in digits
True
>>> 8 in digits
True
```

Built-in operators for testing whether an element appears in a compound value

```
>>> digits = [1, 8, 2, 8]
>>> 1 in digits
True
>>> 8 in digits
True
>>> 5 not in digits
True
```

Built-in operators for testing whether an element appears in a compound value

```
>>> digits = [1, 8, 2, 8]
>>> 1 in digits
True
>>> 8 in digits
True
>>> 5 not in digits
True
>>> not(5 in digits)
True
```

Built-in operators for testing whether an element appears in a compound value

```
>>> digits = [1, 8, 2, 8]
>>> 1 in digits
True
>>> 8 in digits
True
>>> 5 not in digits
True
>>> not(5 in digits)
True
```

(Demo)

For Statements

(Demo)

Sequence Iteration	

Sequence Iteration

```
def count(s, value):
    total = 0
    for element in s:

    if element == value:
        total = total + 1
    return total
```

Sequence Iteration

```
def count(s, value):
    total = 0
    for element in s:

        Name bound in the first frame
        of the current environment
            (not a new frame)

        if element == value:
            total = total + 1
        return total
```

1. Evaluate the header <expression>, which must yield an iterable value (a sequence)

- 1. Evaluate the header <expression>, which must yield an iterable value (a sequence)
- 2. For each element in that sequence, in order:

- 1. Evaluate the header <expression>, which must yield an iterable value (a sequence)
- 2. For each element in that sequence, in order:
 - A. Bind <name> to that element in the current frame

- 1. Evaluate the header <expression>, which must yield an iterable value (a sequence)
- 2. For each element in that sequence, in order:
 - A. Bind <name> to that element in the current frame
 - B. Execute the <suite>

Sequence Unpacking in For Statements	

```
>>> pairs = [[1, 2], [2, 2], [3, 2], [4, 4]]
>>> same_count = 0
```

```
A sequence of fixed-length sequences

>>> pairs = [[1, 2], [2, 2], [3, 2], [4, 4]]

>>> same_count = 0
```

```
A sequence of fixed-length sequences

>>> pairs = [[1, 2], [2, 2], [3, 2], [4, 4]]

>>> same_count = 0
```

```
A sequence of
                  fixed-length sequences
>>> pairs = [[1, 2], [2, 2], [3, 2], [4, 4]]
>>> same_count = 0
     A name for each element in a
         fixed-length sequence
>>> for(x, y) in pairs:
        if x == y:
            same_count = same_count + 1
>>> same_count
```

```
A sequence of
                  fixed-length sequences
>>> pairs = [[1, 2], [2, 2], [3, 2], [4, 4]]
>>> same_count = 0
     A name for each element in a
                                       Each name is bound to a value, as in
         fixed-length sequence
                                       multiple assignment
>>> for(x, y) in pairs:
        if x == y:
            same_count = same_count + 1
>>> same_count
```

 $^{^{}st}$ Ranges can actually represent more general integer sequences.

$$\dots$$

```
>>> letters = ['a', 'b', 'c', 'd', 'e', 'f', 'm', 'n', 'o', 'p']
>>> [letters[i] for i in [3, 4, 6, 8]]
```

```
>>> letters = ['a', 'b', 'c', 'd', 'e', 'f', 'm', 'n', 'o', 'p']
>>> [letters[i] for i in [3, 4, 6, 8]]

['d', 'e', 'm', 'o']
```

[<map exp> for <name> in <iter exp> if <filter exp>]

```
[<map exp> for <name> in <iter exp> if <filter exp>]
```

Short version: [<map exp> for <name> in <iter exp>]

14

```
[<map exp> for <name> in <iter exp> if <filter exp>]
```

Short version: [<map exp> for <name> in <iter exp>]

```
[<map exp> for <name> in <iter exp> if <filter exp>]
```

Short version: [<map exp> for <name> in <iter exp>]

A combined expression that evaluates to a list using this evaluation procedure:

1. Add a new frame with the current frame as its parent

```
[<map exp> for <name> in <iter exp> if <filter exp>]
```

Short version: [<map exp> for <name> in <iter exp>]

- 1. Add a new frame with the current frame as its parent
- 2. Create an empty result list that is the value of the expression

```
[<map exp> for <name> in <iter exp> if <filter exp>]
Short version: [<map exp> for <name> in <iter exp>]
```

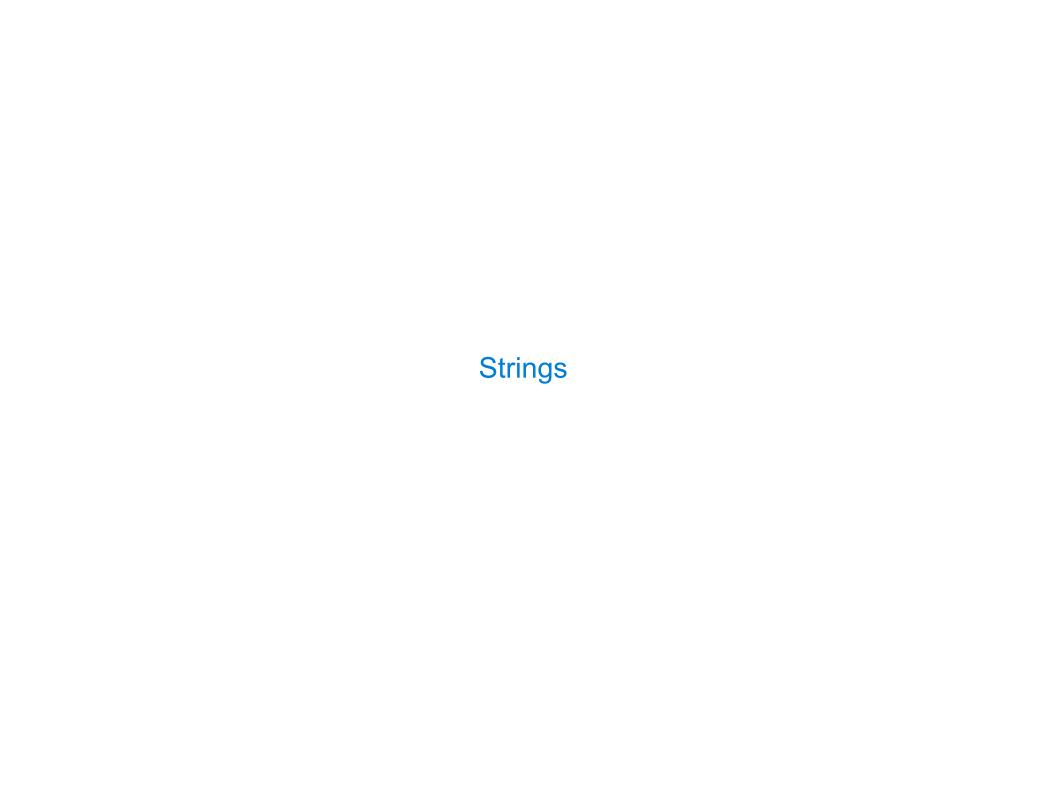

- 1. Add a new frame with the current frame as its parent
- 2. Create an empty result list that is the value of the expression
- 3. For each element in the iterable value of <iter exp>:

```
[<map exp> for <name> in <iter exp> if <filter exp>]
Short version: [<map exp> for <name> in <iter exp>]
```

- 1. Add a new frame with the current frame as its parent
- 2. Create an empty result list that is the value of the expression
- 3. For each element in the iterable value of <iter exp>:
 - A. Bind <name> to that element in the new frame from step 1

```
[<map exp> for <name> in <iter exp> if <filter exp>]
Short version: [<map exp> for <name> in <iter exp>]
```

- 1. Add a new frame with the current frame as its parent
- 2. Create an empty result list that is the value of the expression
- 3. For each element in the iterable value of <iter exp>:
 - A. Bind <name> to that element in the new frame from step 1
 - B. If <filter exp> evaluates to a true value, then add the value of <map exp> to the result list
