# 61A Lecture 24

Monday, March 30

#### Announcements

- Homework 7 due Wednesday 4/8 @ 11:59pm
- •Quiz 3 released Tuesday 4/7, due Thursday 4/9 @ 11:59pm
  - •Open note, open interpreter, closed classmates, closed Internet
- Composition corrections for projects 1, 2, & 3 are due Monday 4/13 @ 11:59pm (do them now!)
  - •Make changes to your project based on the composition feedback you received
  - Earn back any points you lost on composition

## Scheme is a Dialect of Lisp

What are people saying about Lisp?

- "The greatest single programming language ever designed."
   Alan Kay, co-inventor of Smalltalk and OOP (from the user interface video)
- "The only computer language that is beautiful."Neal Stephenson, DeNero's favorite sci-fi author

#### Scheme Fundamentals

Scheme programs consist of expressions, which can be:

- Primitive expressions: 2, 3.3, true, +, quotient, ...
- Combinations: (quotient 10 2), (not true), ...

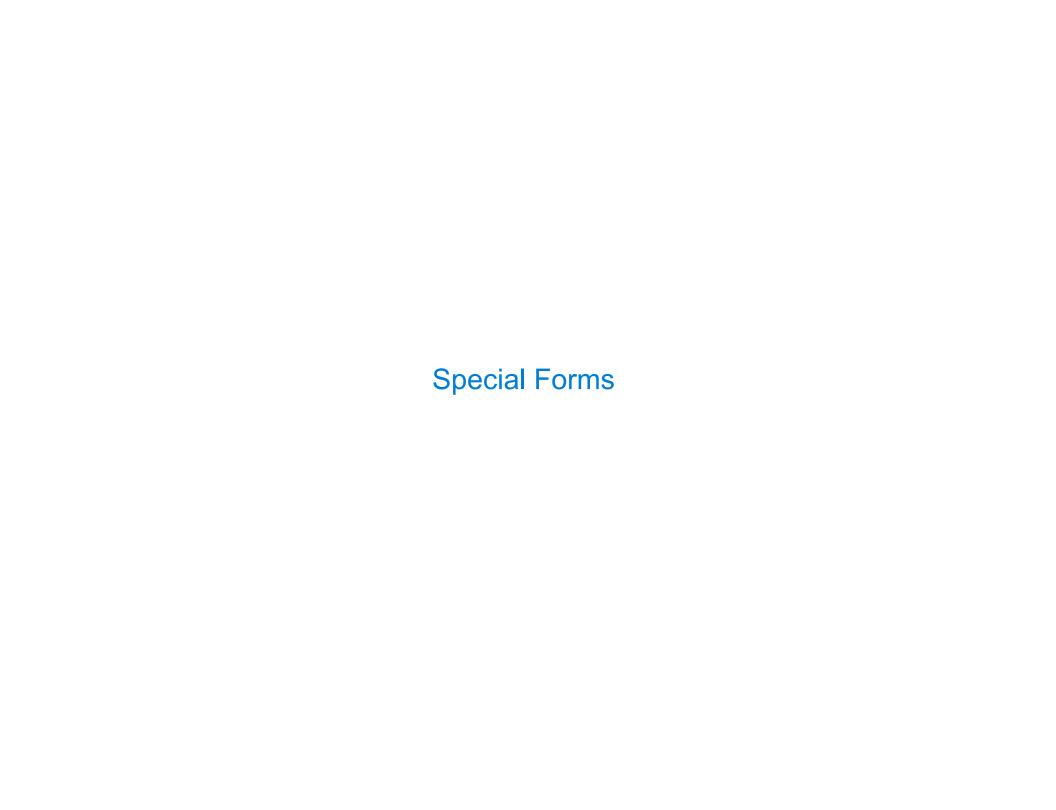

Numbers are self-evaluating; symbols are bound to values

Call expressions include an operator and 0 or more operands in parentheses

```
> (quotient 10 2)
5
> (quotient (+ 8 7) 5)
3
> (quotient (+ 8 7) 5)
Graph (+ 3 5)))
Combinations can span multiple lines (spacing doesn't matter)

(Demo)
(quotient" names Scheme's built-in integer division procedure (i.e., function)

(combinations can span multiple lines (spacing doesn't matter)
```

### **Special Forms**

A combination that is not a call expression is a special form:

```
• if expression: (if <predicate> <consequent> <alternative>)
```

- and and or: (and <e1> ... <en>), (or <e1> ... <en>)
- Binding symbols: (define <symbol> <expression>)
- New procedures: (define (<symbol> <formal parameters>) <body>)

#### Evaluation:

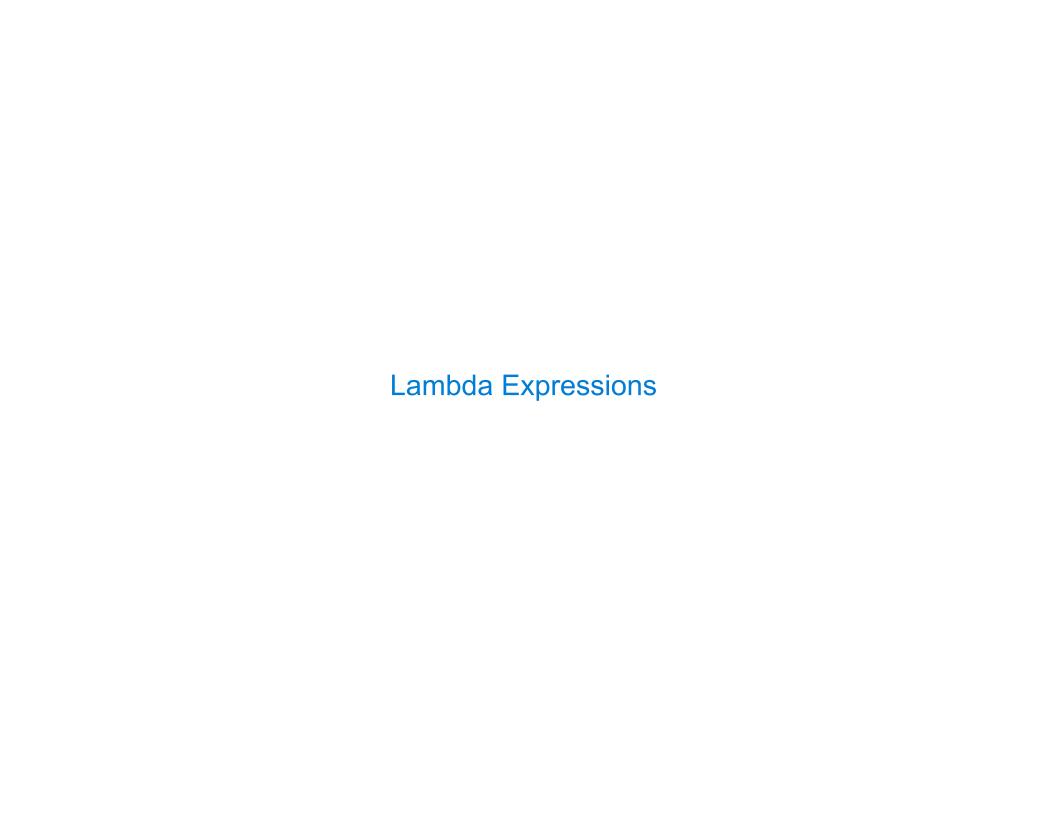

- (1) Evaluate the predicate expression
- (2) Evaluate either the consequent or alternative

```
> (\frac{\text{define pi}}{\text{symbol "pi" is bound to 3.14 in the global frame}})
> (\frac{\text{define pi}}{\text{symbol "pi" is bound to 3.14 in the global frame}})
> (\frac{\text{define (abs x)}}{\text{(if (< x 0)}})
A procedure is created and bound to the symbol "abs"

(abs -3)
3 (Demo)
```

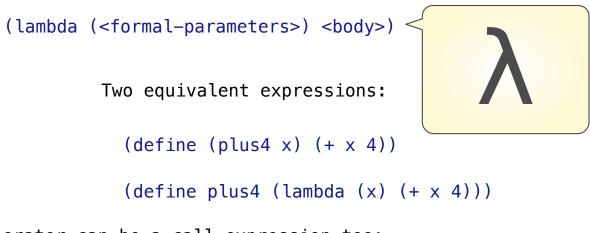

**Scheme Interpreters** 

(Demo)

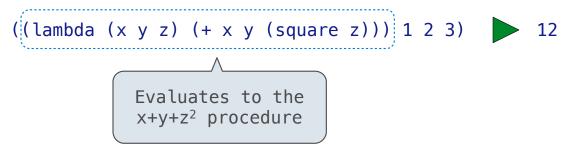

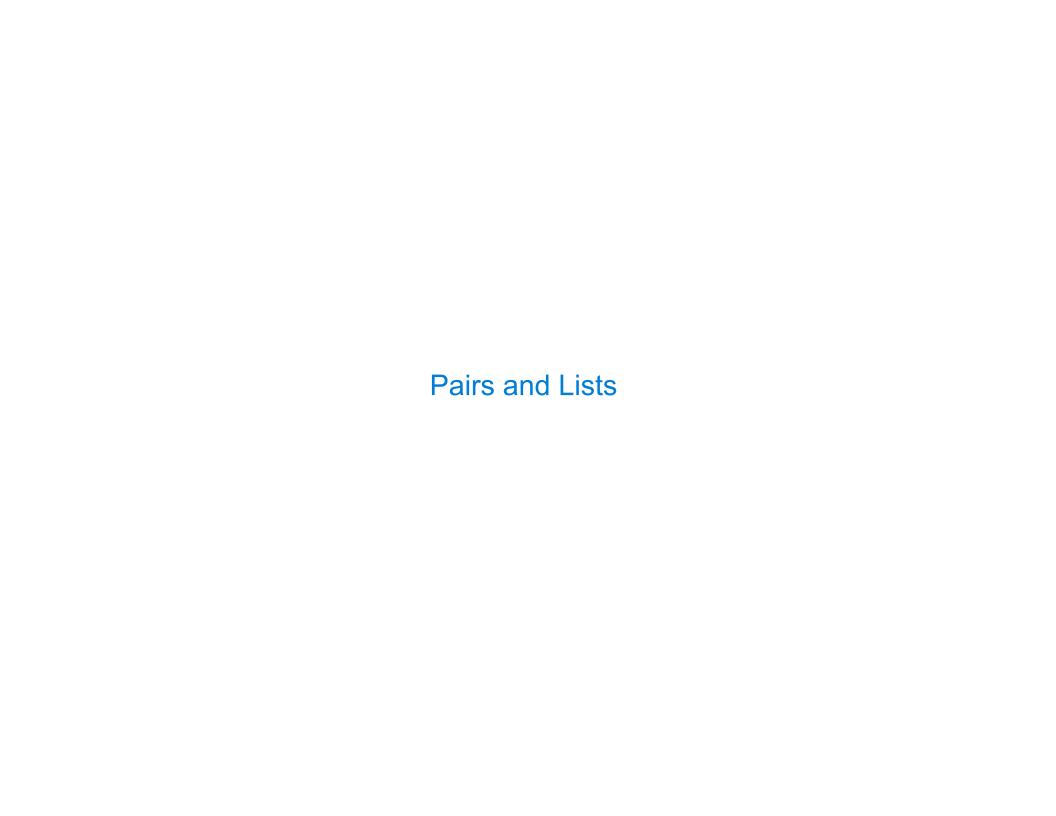

## Lambda Expressions

Lambda expressions evaluate to anonymous procedures

An operator can be a call expression too:

#### Pairs and Lists

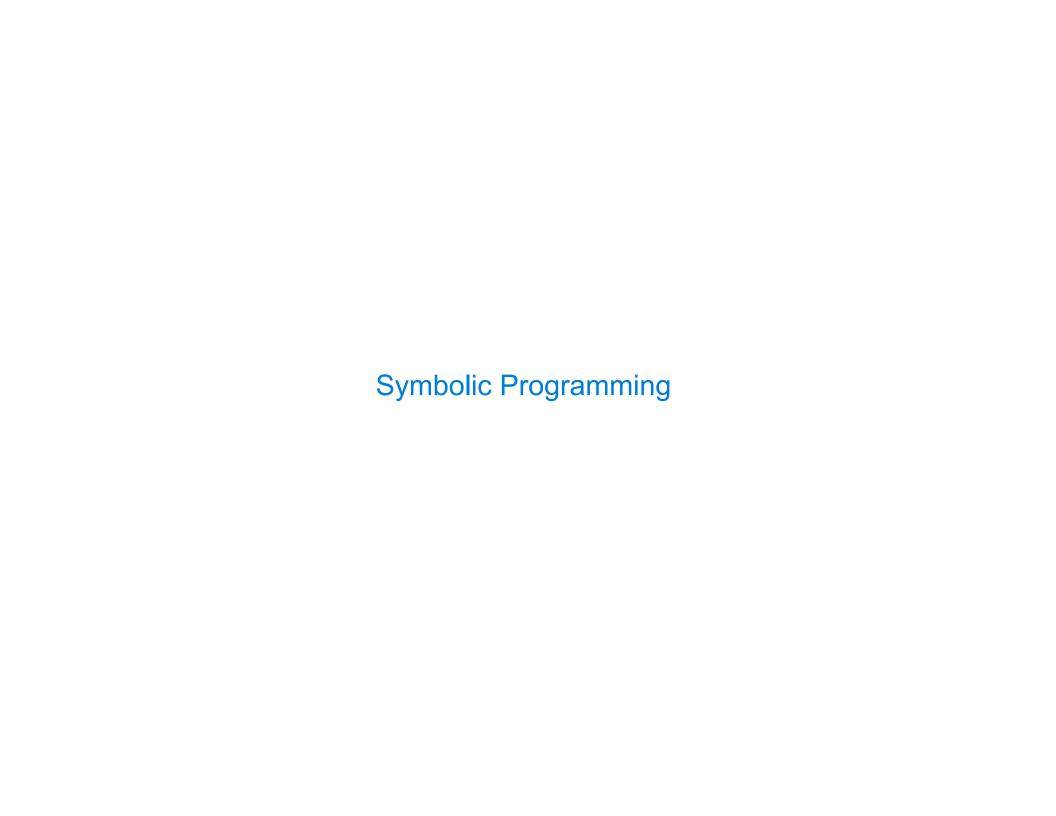

In the late 1950s, computer scientists used confusing names

- cons: Two-argument procedure that creates a pair
- car: Procedure that returns the first element of a pair
- cdr: Procedure that returns the second element of a pair
- nil: The empty list

They also used a non-obvious notation for linked lists

- A (linked) list in Scheme is a pair in which the second element is **nil** or a Scheme list.
- Important! Scheme lists are written in parentheses separated by spaces
- A dotted list has any value for the second element of the last pair; maybe not a list!

```
> (define x (cons 1 2))
> x
(1 . 2)
> (car x)
1
> (cdr x)
2
> (cons 1 (cons 2 (cons 3 (cons 4 nil))))
(1 2 3 4)
(Demo)
```

## Symbolic Programming

Symbols normally refer to values; how do we refer to symbols?

Quotation is used to refer to symbols directly in Lisp.

```
> (list 'a 'b)
(a b)
> (list 'a b)
(a 2)
Symbols are now values
```

Quotation can also be applied to combinations to form lists.

```
> (car '(a b c))
a
> (cdr '(a b c))
(b c)
```

### Scheme Lists and Quotation

Dots can be used in a quoted list to specify the second element of the final pair.

```
> (cdr (cdr '(1 2 . 3)))
3
```

However, dots appear in the output only of ill-formed lists.

What is the printed result of evaluating this expression?

Sierpinski's Triangle

(Demo)
