INSTRUCTIONS

- You have 10 minutes to complete this quiz.
- The exam is closed book, closed notes, closed computer, closed calculator.
- The final score for this quiz will be assigned based on effort rather than correctness.
- Mark your answers on the exam itself. We will not grade answers written on scratch paper.
- For multiple choice questions,
  - ☐ means mark all options that apply
  - ☐ means mark a single choice

1. (5 points) Sequels

Assume that the following table of movie ratings has been created.

```sql
create table ratings as
select "The Matrix" as title, 1999 as year, 9 as rating union
select "The Matrix Reloaded", 2003, 7 union
select "The Matrix Revolutions", 2003, 5 union
select "Toy Story", 1994, 8 union
select "Toy Story 2", 1999, 8 union
select "Toy Story 3", 2010, 9 union
select "Terminator", 1984, 8 union
select "Judgment Day", 1991, 9 union
select "Rise of the Machines", 2003, 5;
```

Express the following queries in SQL using only features we’ve covered in this course.

(a) (1 pt) Select the titles of all movies that have a rating greater than 7 in alphabetical order.

```sql
select title from ratings where rating > 7 order by title;
```

(b) (2 pt) Select the titles of all movie triplets for which there exist 3 movies that have the same rating. Include the titles of all three movies in the result. The results should appear in alphabetical order.

```
Judgement Day|The Matrix|Toy Story 3
Terminator|Toy Story|Toy Story 2
```

```sql
select r1.title, r2.title, r3.title
from ratings as r1, ratings as r2, ratings as r3
where r1.rating = r2.rating and r2.rating = r3.rating and r1.title < r2.title and
r2.title < r3.title order by r1.title, r2.title, r3.title;
```

(c) (2 pt) For each group of movies containing at least 2 movies with the same rating, select the rating and year difference (from the group average) of the first movie released to achieve that rating. For example, The Matrix Reloaded was the only movie to receive a rating of 7 so it does not have a group. Judgement Day was released in 1991, 9 years before the average year (2000) for movies rated 9.

```
5|0
8|-8.333333333333258
9|-9
```

```sql
with average as (select rating, avg(year) as year
from ratings group by rating having count(*) >= 2)
select ratings.rating, min(ratings.year - average.year)
from ratings, average
where ratings.rating = average.rating
group by ratings.rating;
```
The printed copy of this quiz had a bug in the problem because it asked for the title of the first movie released to achieve each rating. There’s a problem of ambiguity when aggregating the rows in a group: once we’ve reduced all the rows into one row consisting of the lowest year difference, how do we know which title corresponds to that year? Different SQL engines behave differently when trying to answer this question since it is not compliant SQL. Some SQL engines will not even process this query! A nice extension exercise would be to think of how we could correctly solve the original problem of choosing the title of the first movie to achieve the rating, along with the year difference. A solution most likely requires a little more skeleton than what was provided on the quiz.
