

CS 61B Discussion 5: Inheritance II Fall 2018

1 Inheritance Practice

```
public class Q {
    public void a() {
        System.out.println("Q.a");
    }
    public void b() {
        a();
    }
    public void c() {
        e();
    }
    public void d() {
        e();
    }
    public static void e() {
        System.out.println("Q.e");
    }
}

public class R extends Q {
    public void a() {
        System.out.println("R.a");
    }
    public void d() {
        e();
    }
    public static void e() {
        System.out.println("R.e");
    }
}

public class S {
    public static void main(String[] args) {
        R aR = new R();
        run(aR);
    }
    public static void run(Q x) {
        x.a();
        x.b();
        x.c();
        ((R)x).c();
        x.d();
        ((R)x).d();
    }
}
```

In run, write what gets printed next to each line.

2 Reduce

We'd like to write a method `reduce`, which uses a `BinaryFunction` interface to accumulate the values of a `List` of integers into a single value. `BinaryFunction` can operate (through the `apply` method) on two integer arguments and return a single integer. Note that `reduce` can now work with a range of binary functions (addition and multiplication, for example). Write two classes `Adder` and `Multiplier` that implement `BinaryFunction`. Then, fill in `reduce` and `main`, and define types for `add` and `mult` in the space provided.

```
import java.util.ArrayList;
import java.util.List;
public class ListUtils {
    /** If the list is empty, return 0.
     *  If it has one element, return that element.
     *  Otherwise, apply a function of two arguments cumulatively to the
     *  elements of list and return a single accumulated value.
     */
    public static int reduce(BinaryFunction func, List<Integer> list) {

    }

    public static void main(String[] args) {
        ArrayList<Integer> integers = new ArrayList<>();
        integers.add(2); integers.add(3); integers.add(4);
        _____ add = _____;
        _____ mult = _____;
        reduce(add, integers); // Should evaluate to 9
        reduce(mult, integers); // Should evaluate to 24
    }
}

interface BinaryFunction {
    int apply(int x, int y);
}

//Add additional classes below:
```

3 Comparator

We'd like to sort an `ArrayList` of animals into ascending order, by age. We can accomplish this using `Collections.sort(List<T> list, Comparator<? super T> c)`. Because instances of the `Animal` class (reproduced below) have no natural ordering, `sort` requires that we write an implementation of the `Comparator` interface that can provide an ordering for us. Note that an implementation of `Comparator` only needs to support pairwise comparison (see the `compare` method). Remember that we would like to sort in ascending order of age, so an `Animal` that is 3 years old should be considered "less than" one that is 5 years old.

Note: for this question, you do not need to worry about implementing `equals`.

```
1 public interface Comparator<T> {
2     /** Compares its two arguments for order.
3     * Returns a negative integer, zero, or a positive integer if the first
4     * argument is less than, equal to, or greater than the second. */
5     int compare(T o1, T o2);
6
7     /** Indicates whether some other object is "equal to" this
8     * comparator. */
9     boolean equals(Object obj);
10 }
11
12 import java.util.ArrayList;
13 import java.util.Collections;
14 public class Animal {
15     private String name;
16     private int age;
17     public Animal(String name, int age) {
18         this.name = name;
19         this.age = age;
20     }
21     /** Returns this animal's age. */
22     public int getAge() {
23         return this.age;
24     }
25     public static void main(String[] args) {
26         ArrayList<Animal> animals = new ArrayList<>();
27         animals.add(new Animal("Garfield", 4));
28         animals.add(new Animal("Biscuit", 2));
29         Animal Comparator c = new AnimalComparator(); //Initialize comparator
30         Collections.sort(animals, c);
31     }
32 }
33
34 import java.util.Comparator;
35 public class AnimalComparator implements Comparator< _____ > {
36
37 }
```

4 Midterm Practice

```
public class PasswordChecker {
    /**
     * Asks you to login (by providing your username and password)
     */
    public void loginPrompt(User u) {
        u.login(this);
    }
    public boolean authenticate(String a, String b) {
        // Does something secret
    }
}

public class User {
    private String username;
    private String password;

    public void login(PasswordChecker p) {
        p.authenticate(username, password);
    }
}
```

Write a class containing a method `public String extractPassword(User u)` which returns the password of a given user `u`. You may not alter the provided classes. Note the access modifiers of instance variables.

```
public class PasswordExtractor extends _____ {
```

```
    public String extractPassword(User u) {
```

```
}
```
