CS 61B Discussion 7: Asymptotics Fall 2021

1 Basic Algorithmic Analysis

For each of the following function pairs f and g, list out the Θ, Ω, O relationships between f and g, if any such relationship exists. For example, $f(x) \in O(g(x))$.

1. $f(x) = x^2$, $g(x) = x^2 + x$
2. $f(x) = 5000000x^3$, $g(x) = x^5$
3. $f(x) = \log(x)$, $g(x) = 5x$
4. $f(x) = e^x$, $g(x) = x^5$
5. $f(x) = \log(5^x)$, $g(x) = x$

2 Practice with Runtime

For each of the following functions, find the Big-Theta expression for the runtime of the function in terms of the input variable n.

You may find the following relations helpful:

$$1 + 2 + 3 + 4 + \cdots + N = \Theta(N^2)$$

$$1 + 2 + 4 + 8 + \cdots + N = \Theta(N)$$

1. For this problem, you may assume that the static method `constant` runs in $\Theta(1)$ time.

```java
public static void bars(int n) {
    for (int i = 0; i < n; i += 1) {
        for (int j = 0; j < i; j += 1) {
            System.out.println(i + j);
        }
    }

    for (int k = 0; k < n; k += 1) {
        constant(k);
    }
}
```

2. Determine the runtime for `barsRearranged`.

```java
public static void cowsGo(int n) {
    for (int i = 0; i < 100; i += 1) {
        for (int j = 0; j < i; j += 1) {
            for (int k = 0; k < j; k += 1) {
                System.out.println("moove");
            }
        }
    }
}

public static void barsRearranged(int n) {
    for (int i = 1; i <= n; i *= 2) {
        for (int j = 0; j < i; j += 1) {
            cowsGo(j);
        }
    }
}
```

3 A Bit on Bits

Recall the following bit operations and shifts:

1. Mask (x & y): yields 1 only if both bits are 1.
   01110 & 10110 = 00110

2. Set (x | y): yields 1 if at least one of the bits is 1.
   01110 | 10110 = 11110

3. Flip (x ^ y): yields 1 only if the bits are different.
   01110 ^ 10110 = 11000

4. Flip all (~ x): turns all 1's to 0 and all 0's to 1.
   ~ 01110 = 10001

5. Left shift (x << left_shift): shifts the bits to the left by left_shift places, filling in the right with zeros.
   10110111 << 3 = 10111000

6. Arithmetic right shift (x >> right_shift): shifts the bits to the right by right_shift places, filling in the left bits with the current existing leftmost bit.
   10110111 >> 3 = 11110110
   00110111 >> 3 = 00000110

7. Logical right shift (x >>> right_shift): shifts the bits to the right by right_shift places, filling in the left with zeros.
   10110111 >>> 3 = 00010110

Implement the following two methods. For both problems, `i=0` represents the least significant bit, `i=1` represents the bit to the left of that, and so on.

1. Implement `isBitIOn` so that it returns a boolean indicating if the `ith` bit of `num` has a value of 1. For example, `isBitIOn(2, 0)` should return `false` (the 0th bit is 0), but `isBitIOn(2, 1)` should return `true` (the 1st bit is 1).

```
/** Returns whether the ith bit of num is a 1 or not. */
public static boolean isBitIOn(int num, int i) {

    int mask = 1 ________________________________________;

    return ______________________________________________;
}
```

2. Implement `turnBitIOn` so that it returns the input number but with its `ith` significant bit set to a value of 1. For example, if `num` is 1 (1 in binary is 01), then calling `turnBitIOn(1, 1)` should return the binary number 11 (aka 3).

```
/** Returns the input number but with its ith bit changed to a 1. */
public static int turnBitIOn(int num, int i) {

    int mask = 1 ________________________________________;

    return ______________________________________________;
}
```
