CS 61C:

Great Ideas in Computer Architecture Performance and Floating Point Arithmetic

Instructors:

John Wawrzynek & Vladimir Stojanovic http://inst.eecs.berkeley.edu/~cs61c/

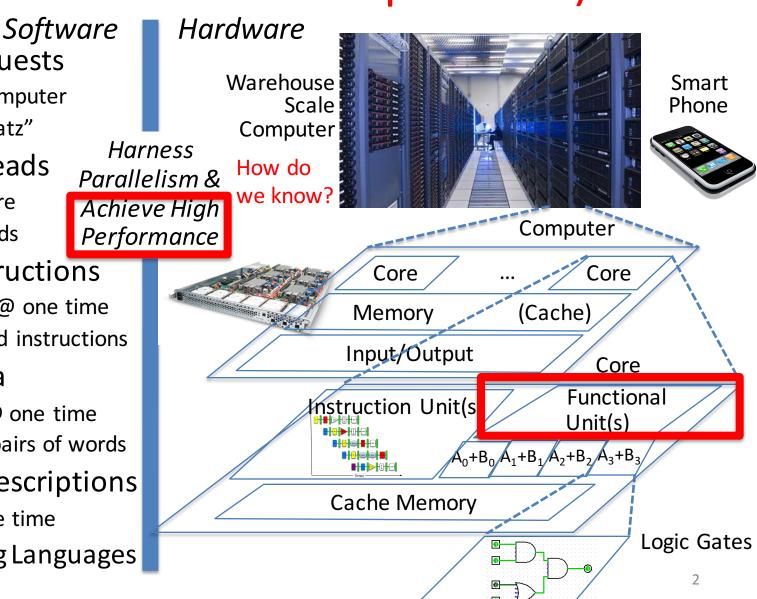

New-School Machine Structures (It's a bit more complicated!)

- Parallel Requests
 Assigned to computer
 e.g., Search "Katz"
- Parallel Threads
 Assigned to core
 e.g., Lookup, Ads
- Parallel Instructions

 >1 instruction @ one time
 e.g., 5 pipelined instructions
- Parallel Data

>1 data item @ one time e.g., Add of 4 pairs of words

- Hardware descriptions
 All gates @ one time
- Programming Languages

What is Performance?

- Latency (or response time or execution time)
 Time to complete one task
- *Bandwidth* (or *throughput*)
 - Tasks completed per unit time

Cloud Performance: Why Application Latency Matters

Server Delay (ms)	Increased time to next click (ms)	Queries/ user	Any clicks/ user	User satisfac- tion	Revenue/ User
50					
200	500		-0.3%	-0.4%	
500	1200		-1.0%	-0.9%	-1.2%
1000	1900	-0.7%	-1.9%	-1.6%	-2.8%
2000	3100	-1.8%	-4.4%	-3.8%	-4.3%

Figure 6.10 Negative impact of delays at Bing search server on user behavior [Brutlag and Schurman 2009].

- Key figure of merit: application responsiveness
 - Longer the delay, the fewer the user clicks, the less the user happiness, and the lower the revenue per user

Defining CPU Performance

- What does it mean to say X is faster than Y?
- Ferrari vs. School Bus?
- 2013 Ferrari 599 GTB

- 2 passengers, quarter mile in 10 secs
- 2013 Type D school bus
 - 50 passengers, quarter mile in 20 secs
- *Response Time (Latency)*: e.g., time to travel ¼ mile
- Throughput (Bandwidth): e.g., passenger-mi in 1 hour

Defining Relative CPU Performance

- Performance_x = $1/Program Execution Time_x$
- Performance_x > Performance_y => 1/Execution Time_x > 1/Execution Time_y => Execution Time_y > Execution Time_x
- Computer X is N times faster than Computer Y Performance_x / Performance_y = N or Execution Time_y / Execution Time_x = N
- Bus to Ferrari performance:
 - Program: Transfer 1000 passengers for 1 mile
 - Bus: 3,200 sec, Ferrari: 40,000 sec

Measuring CPU Performance

- Computers use a clock to determine when events takes place within hardware
- Clock cycles: discrete time intervals

 aka clocks, cycles, clock periods, clock ticks
- *Clock rate* or *clock frequency:* clock cycles per second (inverse of clock cycle time)
- 3 GigaHertz clock rate
 => clock cycle time = 1/(3x10⁹) seconds clock cycle time = 333 picoseconds (ps)

CPU Performance Factors

- To distinguish between processor time and I/O, *CPU time* is time spent in processor
- CPU Time/Program
 - = Clock Cycles/Program
 x Clock Cycle Time
- Or

CPU Time/Program = Clock Cycles/Program ÷ Clock Rate

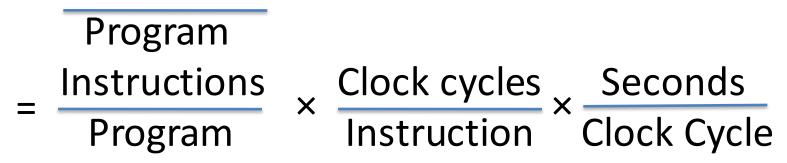

Iron Law of Performance

by Emer and Clark

- A program executes instructions
- CPU Time/Program
 - = Clock Cycles/Program x Clock Cycle Time
 - = Instructions/Program
 - x Average Clock Cycles/Instruction
 - x Clock Cycle Time
- 1st term called *Instruction Count*
- 2nd term abbreviated CPI for average
 Clock Cycles Per Instruction
- 3rd term is 1 / Clock rate

Restating Performance Equation

• Time = Seconds

What Affects Each Component? A)Instruction Count, B)CPI, C)Clock Rate

	Affects What? (click in letter of component not affected)

What Affects Each Component? Instruction Count, CPI, Clock Rate

	Affects What?
Algorithm	Instruction Count, CPI
Programming Language	Instruction Count, CPI
Compiler	Instruction Count, CPI
Instruction Set Architecture	Instruction Count, Clock Rate, CPI

Clickers

Computer	Clock frequency	Clock cycles per instruction	#instructions per program
А	1GHz	2	1000
В	2GHz	5	800
С	500MHz	1.25	400
D	5GHz	10	2000

• Which computer has the highest performance for a given program?

Workload and Benchmark

- Workload: Set of programs run on a computer
 - Actual collection of applications run or made from real programs to approximate such a mix
 - Specifies programs, inputs, and relative frequencies
- *Benchmark:* Program selected for use in comparing computer performance
 - Benchmarks form a workload
 - Usually standardized so that many use them

SPEC

(System Performance Evaluation Cooperative)

- Computer Vendor cooperative for benchmarks, started in 1989
- SPECCPU2006
 - 12 Integer Programs
 - 17 Floating-Point Programs
- Often turn into number where bigger is faster
- *SPECratio*: reference execution time on old reference computer divide by execution time on new computer to get an effective speed-up

SPECINT2006 on AMD Barcelona

Description	Instruc- tion Count (B)	CPI	Clock cycle time (ps)	Execu- tion Time (s)	Refer- ence Time (s)	SPEC- ratio

CodeBears Announcement

 "CodeBears is a rapidly growing organization on campus aimed at providing members with the opportunity to compete with each other and against teams in other universities in algorithmic software competitions that require strong problem solving abilities. Winners of our intra-college programming competitions will be able to meet with industry leaders, network with founders of various organizations, and represent UCB at inter-college competitions. We hope to create a new hacking culture at Call Learn more about us at:

https://callink.berkeley.edu/organization/codebears

 We already have over 100 registered members and had a tremendous turnout rate at our first GM last Friday! Visit our Facebook page at:<u>https://www.facebook.com/CodeBears</u>to access last Friday's slides and learn how to join CodeBears!

- Computers are made to deal with numbers
- What can we represent in N bits?
 - 2^N things, and no more! They could be...
 - Unsigned integers:

0 to 2^{N} -1 (for N=32, 2^{N} -1 = 4,294,967,295)

Signed Integers (Two's Complement)

(for N=32, $2^{(N-1)} = 2,147,483,648$)

What about other numbers?

- 1. Very large numbers? (seconds/millennium) \Rightarrow 31,556,926,000₁₀ (3.1556926₁₀ x 10¹⁰)
- 3. Numbers with <u>both</u> integer & fractional parts? \Rightarrow 1.5

First consider #3.

...our solution will also help with #1 and #2.

Representation of Fractions

"Binary Point" like decimal point signifies boundary between integer and fractional parts:

$10.1010_{two} = 1x2^{1} + 1x2^{-1} + 1x2^{-3} = 2.625_{ten}$

If we assume "fixed binary point", range of 6-bit representations with this format: 0 to 3.9375 (almost 4)

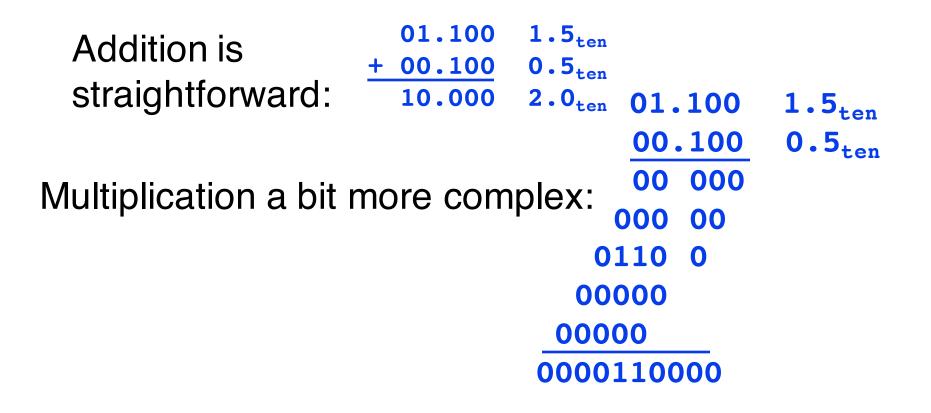

Fractional Powers of 2

i	2 -i	
0	1.0	1
1	0.5	1/2
2	0.25	1/4
3	0.125	1/8
4	0.0625	1/16
5	0.03125	1/32
6	0.015625	
7	0.0078125	5
8	0.0039062	25
9	0.0019531	L25
10	0.0009765	5625
11	0.0004882	28125
12	0.0002441	L40625
13	0.0001220	0703125
14	0.0000610	3515625
15	0.0000305	517578125

Representation of Fractions with Fixed Pt.

What about addition and multiplication?

Where's the answer, 0.11? (need to remember where point is)

Garcia, Fall 2014© UCB

Representation of Fractions

So far, in our examples we used a "fixed" binary point. What we really want is to "float" the binary point. Why?

Floating binary point most effective use of our limited bits (and thus more accuracy in our number representation):

example: put 0.1640625_{ten} into binary. Represent with 5-bits choosing where to put the binary point. ... 000000.001010100000... Store these bits and keep track of the binary point 2 places to the left of the MSB

Any other solution would lose accuracy!

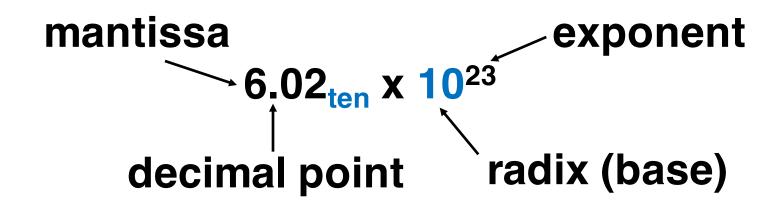

With floating-point rep., each numeral carries an exponent field recording the whereabouts of its binary point.

The binary point can be outside the stored bits, so very large and small numbers can be represented.

CS61C L15 Floating Point I (27)

Garcia, Fall 2014© UCB

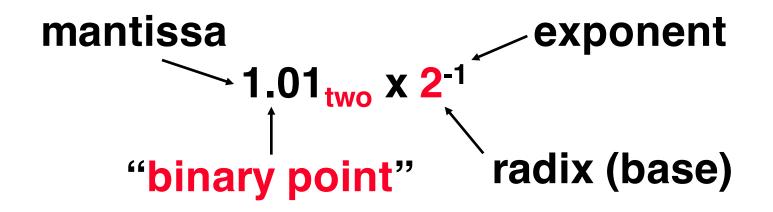

Scientific Notation (in Decimal)

- Normalized form: no leadings 0s (exactly one digit to left of decimal point)
- Alternatives to representing 1/1,000,000,000
 - Normalized: 1.0 x 10⁻⁹
 - Not normalized: 0.1 x 10⁻⁸,10.0 x 10⁻¹⁰

Scientific Notation (in Binary)

- Computer arithmetic that supports it called <u>floating point</u>, because it represents numbers where the binary point is not fixed, as it is for integers
 - Declare such variable in C as float
 - double for double precision.

Floating-Point Representation (1/2)

- Normal format: +1.xxx...x_{two}*2^{yyy...y}two
- Multiple of Word Size (32 bits)

- S represents Sign Exponent represents y's Significand represents x's
- Represent numbers as small as 2.0_{ten} x 10⁻³⁸ to as large as 2.0_{ten} x 10³⁸

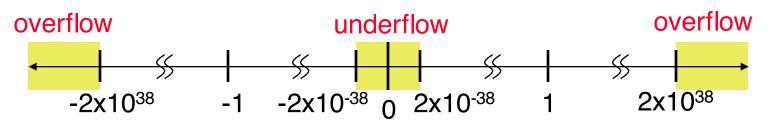

Floating-Point Representation (2/2)

- What if result too large?
 - (> 2.0x10³⁸ , < -2.0x10³⁸)
 - Overflow! ⇒ Exponent larger than represented in 8bit Exponent field
- What if result too small?

 $(>0 \& < 2.0 \times 10^{-38}, <0 \& > -2.0 \times 10^{-38})$

 <u>Underflow!</u> ⇒ Negative exponent larger than represented in 8-bit Exponent field

 What would help reduce chances of overflow and/or underflow?

CS61C L15 Floating Point I (31)

IEEE 754 Floating-Point Standard (1/3)

Single Precision (Double Precision similar):

- ign bit: 1 means negative 0 means positive
- Significand in *sign-magnitude* format (not 2's complement)
 - To pack more bits, leading 1 implicit for normalized numbers
 - 1 + 23 bits single, 1 + 52 bits double
 - always true: 0 < Significand < 1 (for normalized numbers)

• Note: 0 has no leading 1, so reserve exponent value 0 just for number 0

IEEE 754 Floating Point Standard (2/3)

IEEE 754 uses "biased exponent" representation

- Designers wanted FP numbers to be used even if no FP hardware; e.g., sort records with FP numbers using integer compares
- Wanted bigger (integer) exponent field to represent bigger numbers
- 2's complement poses a problem (because negative numbers look bigger)
 - Use just magnitude and offset by half the range

IEEE 754 Floating Point Standard (3/3)

- Called <u>Biased Notation</u>, where bias is number subtracted to get final number
 - IEEE 754 uses bias of 127 for single prec.
 - Subtract 127 from Exponent field to get actual value for exponent

 Summary (single precision): 				
31 30 23				
S Exponent Significand				
1 bit 8 bits 23 bits				
•(-1) ^S x (1 + Significand) x 2 ^(Exponent-127)				
• Double precision identical, except with • A exponent bias of 1023 (balf, guad similar)				

iaii, yuau Silli

"Father" of the Floating point standard

IEEE Standard 754 for Binary Floating-Point Arithmetic.

Prof. Kahan

www.cs.berkeley.edu/~wkahan/ieee754status/754story.html

Garcia, Fall 2014© UCB

Clickers

A: $-1x \ 2^{128}$ B: $+1x \ 2^{-128}$ C: $-1x \ 2^{1}$ D: $+1.5x \ 2^{-1}$ E: $-1.5x \ 2^{1}$

Representation for $\pm \infty$

- In FP, divide by 0 should produce ± ∞, not overflow.
- •Why?
 - OK to do further computations with ∞
 E.g., X/0 > Y may be a valid comparison

- IEEE 754 represents ± ∞
 - $\bullet \textit{Most positive exponent reserved for } \infty$
 - Significands all zeroes

Representation for 0

- Represent 0?
 - exponent all zeroes
 - significand all zeroes
 - What about sign? Both cases valid

Special Numbers

• What have we defined so far? (Single Precision)

Exponent	Significand	Object
0	0	0
0	nonzero	???
1-254	anything	+/- fl. pt. #
255	0	+/-∞
255	nonzero	???

Professor Kahan had clever ideas:

Wanted to use Exp=0,255 & Sig!=0

Representation for Not a Number

- What do I get if I calculate sqrt(-4.0) or 0/0?
 - If ∞ not an error, these shouldn't be either
 - Called <u>Not a Number (NaN)</u>
 - Exponent = 255, Significand nonzero
- Why is this useful?
 - Hope NaNs help with debugging?
 - They contaminate: op(NaN, X) = NaN
 - Can use the significand to identify which!

Representation for Denorms (1/2)

- Problem: There's a gap among representable FP numbers around 0
 - Smallest representable pos num:

 $a = 1.0..._{2} * 2^{-126} = 2^{-126}$

Second smallest representable pos num:

$$b = 1.000....1_{2} * 2^{-126}$$

= (1 + 0.00...1_{2}) * 2^{-126}
= (1 + 2^{-23}) * 2^{-126}
= 2^{-126} + 2^{-149}
a - 0 = 2^{-126} = 2^{-126} = 0 = 2^{-126}
b - a = 2^{-149} Gaps!
- $\infty \leftarrow 0 = \frac{b}{a} + \infty$

Representation for Denorms (2/2)

Solution:

- We still haven't used Exponent = 0, Significand nonzero
- <u>DEnormalized number</u>: no (implied) leading 1, implicit exponent = -126.
- Smallest representable pos num:

a = 2⁻¹⁴⁹

Second smallest representable pos num:

 $b = 2^{-148}$

$$-\infty$$
 + + + + + + + + + + ∞

Special Numbers Summary

Reserve exponents, significands: Exponent Significand Object ()nonzero Denorm anything +/- fl. pt. # 1-254 +/-∞ 255 Π 255 NaN nonzero

Garcia, Fall 2014© UCB

www.h-schmidt.net/FloatApplet/IEEE754.html

Conclusion

Floating Point lets us:

Exponent tells Significand how much (2ⁱ) to count by (..., 1/4, 1/2, 1, 2, ...)

- Represent numbers containing both integer and fractional parts; makes efficient use of available bits.
- Store approximate values for very large and very small #s.
- IEEE 754 Floating-Point Standard is most widely accepted attempt to standardize interpretation of such numbers (Every desktop or server computer sold since ~1997 follows these conventions)

| Summary (single precision): | |
|--|-------------|
| 3130 23 | 22 0 |
| S Exponent | Significand |
| 1 bit 8 bits | 23 bits |
| •(-1) ^S x (1 + Significand) x 2 ^(Exponent-127) | |
| Double precision identical, except with
exponent bias of 1023 (half, quad similar) | |

Can

store

NaN,

And In Conclusion, ...

- Time (seconds/program) is measure of performance
 = Instructions × Clock cycles × Seconds
 Program × Instruction × Clock Cycle
- Floating-point representations hold approximations of real numbers in a finite number of bits
