Voting machine usability ⇒  
 In a study of electronic voting machines, researchers found that people made errors 3% of the time on simple tasks, but 15% of the time on complicated tasks, such as switching their vote to another candidate!

CS61C L04 Introduction to C (pt 2) (1) Garcia, Spring 2008 © UCB

**More C Pointer Dangers**

- Declaring a pointer just allocates space to hold the pointer – it does not allocate something to be pointed to!
- Local variables in C are not initialized, they may contain anything.
- What does the following code do?

```
void f()
{
    int *ptr;
    *ptr = 5;
}
```

 CS61C L04 Introduction to C (pt 2) (3) Garcia, Spring 2008 © UCB

**Arrays (1/5)**

- Declaration:

```
int ar[2];
```

declares a 2-element integer array. An array is really just a block of memory.

```
int ar[] = {795, 635};
```

declares and fills a 2-elt integer array.

- Accessing elements:

```
ar[num]
```

 returns the num<sup>th</sup> element.

CS61C L04 Introduction to C (pt 2) (4) Garcia, Spring 2008 © UCB

**Arrays (2/5)**

- Arrays are (almost) identical to pointers

- char \*string and char string[] are nearly identical declarations
- They differ in very subtle ways: incrementing, declaration of filled arrays

- Key Concept: An array variable is a "pointer" to the first element.

 CS61C L04 Introduction to C (pt 2) (5) Garcia, Spring 2008 © UCB

**Arrays (3/5)**

- Consequences:

- ar is an array variable but looks like a pointer in many respects (though not all)
- ar[0] is the same as \*ar
- ar[2] is the same as \*(ar+2)
- We can use pointer arithmetic to access arrays more conveniently.

- Declared arrays are only allocated while the scope is valid

```
char *foo() {
    char string[32]; ...;
    return string;
} is incorrect
```

 CS61C L04 Introduction to C (pt 2) (6) Garcia, Spring 2008 © UCB

**Arrays (4/5)**

- Array size n; want to access from 0 to n-1, so you should use counter AND utilize a constant for declaration & incr

- Wrong

```
int i, ar[10];
for(i = 0; i < 10; i++){ ... }
```

- Right

```
#define ARRAY_SIZE 10
int i, a[ARRAY_SIZE];
for(i = 0; i < ARRAY_SIZE; i++){ ... }
```

- Why? SINGLE SOURCE OF TRUTH
- You're utilizing indirection and avoiding maintaining two copies of the number 10

 CS61C L04 Introduction to C (pt 2) (7) Garcia, Spring 2008 © UCB

## Arrays (5/5)

- **Pitfall: An array in C does not know its own length, & bounds not checked!**
  - Consequence: We can accidentally access off the end of an array.
  - Consequence: We must pass the array and its size to a procedure which is going to traverse it.
- **Segmentation faults and bus errors:**
  - These are VERY difficult to find; be careful! (You'll learn how to debug these in lab...)

CS61C L04 Introduction to C (pt 2) (8)

Garcia, Spring 2008 © UCB

## Pointer Arithmetic (1/2)

- Since a pointer is just a mem address, we can add to it to traverse an array.
- $p+1$  returns a ptr to the next array elt.
- **\*p++ vs (\*p)++ ?**
  - $x = *p++ \Rightarrow x = *p ; p = p + 1 ;$
  - $x = (*p)++ \Rightarrow x = *p ; *p = *p + 1 ;$
- What if we have an array of large structs (objects)?
  - C takes care of it: In reality,  $p+1$  doesn't add 1 to the memory address, it adds the size of the array element.

CS61C L04 Introduction to C (pt 2) (9)

Garcia, Spring 2008 © UCB

## Pointer Arithmetic (2/2)

- C knows the size of the thing a pointer points to – every addition or subtraction moves that many bytes.
  - 1 byte for a char, 4 bytes for an int, etc.

- So the following are equivalent:

```
int get(int array[], int n)
{
    return array[n];
    // OR...
    return *(array + n);
}
```

CS61C L04 Introduction to C (pt 2) (10)

Garcia, Spring 2008 © UCB

## Pointers in C

- Why use pointers?

- If we want to pass a huge struct or array, it's easier to pass a pointer than the whole thing.
- In general, pointers allow cleaner, more compact code.

- So what are the drawbacks?

- Pointers are probably the single largest source of bugs in software, so be careful anytime you deal with them.
- **Dangling reference** (premature free)
- **Memory leaks** (tardy free)

CS61C L04 Introduction to C (pt 2) (11)

Garcia, Spring 2008 © UCB

## C Strings

- A **string** in C is just an array of characters.

```
char string[] = "abc";
```

- How do you tell how long a string is?

- Last character is followed by a 0 byte (null terminator)

```
int strlen(char s[])
{
    int n = 0;
    while (s[n] != 0) n++;
    return n;
}
```

CS61C L04 Introduction to C (pt 2) (12)

Garcia, Spring 2008 © UCB

## Peer Instruction Question

```
void main(); {
    int *p, x=5, y; // init
    y = *(p = &x) + 10;
    int z;
    flip-sign(p);
    printf("x=%d,y=%d,p=%d\n",x,y,p);
}
flip-sign(int *n){*n = -(*n)}
```

How many syntax/logic errors in this C99 code?

#Errors

## Pointer Arithmetic Peer Instruction Q

How many of the following are **invalid**?

- I. pointer + integer
- II. integer + pointer
- III. pointer + pointer
- IV. pointer - integer
- V. integer - pointer
- VI. pointer - pointer
- VII. compare pointer to pointer
- VIII. compare pointer to integer
- IX. compare pointer to 0
- X. compare pointer to NULL

#invalid
1
2
3
4
5
6
7
8
9
(1) 0

CS61C L04 Introduction to C (pt 2) (15)

## Peer Instruction

```
int main(void){
  int A[] = {5,10};
  int *p = A;
  printf("%u %d %d %d\n", p, *p, A[0], A[1]);
  p = p + 1;
  printf("%u %d %d %d\n", p, *p, A[0], A[1]);
  *p = *p + 1;
  printf("%u %d %d %d\n", p, *p, A[0], A[1]);
}
```

If the first printf outputs **100 5 5 10**, what will the other two printf output?

- 1: 101 10 5 10      then 101 11 5 11
- 2: 104 10 5 10      then 104 11 5 11
- 3: 101 <other> 5 10    then 101 <3-others>
- 4: 104 <other> 5 10    then 104 <3-others>
- 5: One of the two printf causes an ERROR
- 6: I surrender!

CS61C L04 Introduction to C (pt 2) (17)

Garcia, Spring 2008 © UCB

## “And in Conclusion...”

- Pointers and arrays are **virtually same**
- C knows how to **increment pointers**
- C is an efficient language, with little protection
  - Array bounds **not checked**
  - Variables **not automatically initialized**
- (Beware) The cost of efficiency is more overhead for the programmer.
  - “C gives you a lot of extra rope but be careful not to hang yourself with it!”

CS61C L04 Introduction to C (pt 2) (18)

## Reference slides

You **ARE** responsible for the material on these slides (they're just taken from the reading anyway) ; we've moved them to the end and off-stage to give more breathing room to lecture!

CS61C L04 Introduction to C (pt 2) (19)

Garcia, Spring 2008 © UCB

## Administrivia

- Read K&R 6 by the next lecture
- There is a language called D!
  - [www.digitalmars.com/d/](http://www.digitalmars.com/d/)
- Answers to the reading quizzes?
  - Ask your TA in discussion
- Homework expectations
  - Readers don't have time to fix your programs which have to run on lab machines.
  - Code that doesn't compile or fails all of the autograder tests ⇒ 0

CS61C L04 Introduction to C (pt 2) (20)

Garcia, Spring 2008 © UCB

## Administrivia

- Slip days
  - You get 3 “slip days” per year to use for any homework assignment or project
  - They are used at 1-day increments. Thus 1 minute late = 1 slip day used.
  - They're recorded automatically (by checking submission time) so you don't need to tell us when you're using them
  - Once you've used all of your slip days, when a project/hw is late, it's ... 0 points.
  - If you submit twice, we ALWAYS grade the latter, and deduct slip days appropriately
  - You no longer need to tell anyone how your dog ate your computer.
  - You should really save for a rainy day ... we all get sick and/or have family emergencies!

CS61C L04 Introduction to C (pt 2) (21)

Garcia, Spring 2008 © UCB

## Pointers & Allocation (1/2)

- After declaring a pointer:

```
int *ptr;
```

`ptr` doesn't actually point to anything yet (*it actually points somewhere - but don't know where!*). We can either:

- make it point to something that already exists, or
- allocate room in memory for something new that it will point to... (next time)

CS61C L04 Introduction to C (pt 2) (22)

Garcia, Spring 2008 © UCB

## Pointers & Allocation (2/2)

- Pointing to something that already exists:

```
int *ptr, var1, var2;
var1 = 5;
ptr = &var1;
var2 = *ptr;
```

- `var1` and `var2` have room implicitly allocated for them.

CS61C L04 Introduction to C (pt 2) (23)

Garcia, Spring 2008 © UCB

## Arrays (one elt past array must be valid)

- Array size `n`; want to access from 0 to `n-1`, but test for exit by comparing to address one element past the array

```
int ar[10], *p, *q, sum = 0;
...
p = &ar[0]; q = &ar[10];
while (p != q)
    /* sum = sum + *p; p = p + 1; */
    sum += *p++;
```

- Is this legal?

- C defines that one element past end of array **must be a valid address**, i.e., not cause a bus error or address error

CS61C L04 Introduction to C (pt 2) (24)

Garcia, Spring 2008 © UCB

## Pointer Arithmetic

- So what's valid pointer arithmetic?

- Add an integer to a pointer.
- Subtract 2 pointers (in the same array).
- Compare pointers (`<`, `<=`, `==`, `!=`, `>`, `>=`)
- Compare pointer to `NULL` (indicates that the pointer points to nothing).

- Everything else is illegal since it makes no sense:

- adding two pointers
- multiplying pointers
- subtract pointer from integer

CS61C L04 Introduction to C (pt 2) (25)

Garcia, Spring 2008 © UCB

## Pointer Arithmetic to Copy memory

- We can use pointer arithmetic to "walk" through memory:

```
void copy(int *from, int *to, int n) {
    int i;
    for (i=0; i<n; i++) {
        *to++ = *from++;
    }
}
```

- Note we had to pass size (`n`) to `copy`

CS61C L04 Introduction to C (pt 2) (26)

Garcia, Spring 2008 © UCB

## Arrays vs. Pointers

- An array name is a read-only pointer to the 0<sup>th</sup> element of the array.
- An array parameter can be declared as an array or a pointer; an array argument can be passed as a pointer.

```
int strlen(char s[])    int strlen(char *s)
{
    int n = 0;          {
    while (s[n] != 0)   {
        n++;            int n = 0;
    }                  while (s[n] != 0)
    return n;          {
                       n++;
                       return n;
}                    }
```

Could be written:  
`while (s[n])`

CS61C L04 Introduction to C (pt 2) (27)

Garcia, Spring 2008 © UCB

## Pointer Arithmetic Summary

- `x = *(p+1) ?`  
⇒ `x = *(p+1) ;`
- `x = *p+1 ?`  
⇒ `x = (*p) + 1 ;`
- `x = (*p)++ ?`  
⇒ `x = *p ; *p = *p + 1 ;`
- `x = *p++ ? (*p++) ? *(p)++ ? *(p++) ?`  
⇒ `x = *p ; p = p + 1 ;`
- `x = **p ?`  
⇒ `p = p + 1 ; x = *p ;`
- Lesson?

Using anything but the standard `*p++`, `(*p)++` causes more problems than it solves!

CS61C L04 Introduction to C (pt 2) (28)

Garcia, Spring 2008 © UCB

## Segmentation Fault vs Bus Error?

- <http://www.hyperdictionary.com/>
- Bus Error
  - A fatal failure in the execution of a machine language instruction resulting from the processor detecting an anomalous condition on its bus. Such conditions include **invalid address alignment** (accessing a multi-byte number at an odd address), accessing a physical address that does not correspond to any device, or some other device-specific hardware error. A bus error triggers a processor-level exception which Unix translates into a "SIGBUS" signal which, if not caught, will terminate the current process.
- Segmentation Fault
  - An error in which a running Unix program attempts to **access memory not allocated** to it and terminates with a segmentation violation error and usually a core dump.

CS61C L04 Introduction to C (pt 2) (29)

Garcia, Spring 2008 © UCB

## C Pointer Dangers

- Unlike Java, C lets you **cast** a value of any type to any other type **without** performing any checking.

```
int x = 1000;
int *p = x;          /* invalid */
int *q = (int *) x; /* valid */
```

- The first pointer declaration is invalid since the types do not match.
- The second declaration is valid C but is almost certainly wrong

Is it ever correct?

CS61C L04 Introduction to C (pt 2) (30)

Garcia, Spring 2008 © UCB

## C Strings Headaches

- One common mistake is to forget to allocate an extra byte for the null terminator.
- More generally, C requires the programmer to manage memory manually (unlike Java or C++).
  - When creating a long string by concatenating several smaller strings, the programmer must insure there is enough space to store the full string!
  - What if you don't know ahead of time how big your string will be?
  - Buffer overrun security holes!

CS61C L04 Introduction to C (pt 2) (31)

Garcia, Spring 2008 © UCB

## Common C Error

- There is a difference between assignment and equality
  - `a = b` is assignment
  - `a == b` is an equality test
- This is one of the most common errors for beginning C programmers!
  - One solution (when comparing with constant) is to put the var on the right! If you happen to use `=`, it won't compile.

```
if (3 == a) { ...
```

CS61C L04 Introduction to C (pt 2) (32)

Garcia, Spring 2008 © UCB

## C String Standard Functions

- `int strlen(char *string);`
  - compute the length of string
- `int strcmp(char *str1, char *str2);`
  - return 0 if `str1` and `str2` are identical (how is this different from `str1 == str2`?)
- `char *strcpy(char *dst, char *src);`
  - copy the contents of string `src` to the memory at `dst`. The caller must ensure that `dst` has enough memory to hold the data to be copied.

CS61C L04 Introduction to C (pt 2) (33)

Garcia, Spring 2008 © UCB
