RISC-V Control Flow

Discussion 3: February 13, 2019

1 RISC-V with Arrays and Lists

Comment what each code block does. Each block runs in isolation. Assume that there is an array, `int arr[6] = {3, 1, 4, 1, 5, 9}`, which starts at memory address `0xBFFFFF00`, and a linked list struct (as defined below), `struct ll* lst`, whose first element is located at address `0xABCD0000`. Let `s0` contain `arr`'s address `0xBFFFFF00`, and let `s1` contain `lst`'s address `0xABCD0000`. You may assume integers and pointers are 4 bytes and that structs are tightly packed. Assume that `lst`'s last node's `next` is a NULL pointer to memory address `0x00000000`.

```
struct ll {
    int val;
    struct ll* next;
}
```

1.1
```
lw  t0, 0(s0)
lw  t1, 8(s0)
add t2, t0, t1
sw  t2, 4(s0)
```

1.2
```
loop: beq  s1, x0, end
      lw   t0, 0(s1)
      addi t0, t0, 1
      sw   t0, 0(s1)
      lw   s1, 4(s1)
      jal  x0, loop
 end:
```

1.3
```
        add  t0, x0, x0
loop:   slti t1, t0, 6
        beq  t1, x0, end
        slli t2, t0, 2
        add  t3, s0, t2
        lw   t4, 0(t3)
        sub  t4, x0, t4
        sw   t4, 0(t3)
        addi t0, t0, 1
        jal  x0, loop
 end:
```

2 RISC-V Calling Conventions

2.1 How do we pass arguments into functions?

2.2 How are values returned by functions?

2.3 What is `sp` and how should it be used in the context of RISC-V functions?

2.4 Which values need to saved by the caller, before jumping to a function using `jal`?

2.5 Which values need to be restored by the callee, before using `jalr` to return from a function?

3 Writing RISC-V Functions

3.1 Write a function `sumSquare` in RISC-V that, when given an integer `n`, returns the summation below. If `n` is not positive, then the function returns 0.

$$n^2 + (n-1)^2 + (n-2)^2 + \ldots + 1^2$$

For this problem, you are given a RISC-V function called `square` that takes in a single integer and returns its square. Implement `sumSquare` using `square` as a subroutine. Be sure to follow RISC-V caller/callee convention. (Hints: for `sumSquare`, in what register can we expect the parameter `n`? What registers should hold `square`'s parameter and return value? In what register should we place the return value of `sumSquare`? What needs to go in `sumSquare`'s prologue and epilogue?)

4 More Translating between C and RISC-V

4.1 Translate between the RISC-V code to C. You may want to use the RISC-V Green Card on the next page as a reference. What is this RISC-V function computing? Assume no stack or memory-related issues, and assume no negative inputs.

C	RISC-V

	`Func: addi t0 x0 1`
	`Loop: and t1 a1 a1`
	`beq t1 x0 Done`
	`mul t0 t0 a0`
	`addi a1 a1 -1`
	`jal x0 Loop`
	`Done: add a0 t0 x0`
	`jr ra`

Notes: 1) The Word version only operates on the rightmost 32 bits of a 64-bit registers
2) Operation assumes unsigned integers (instead of 2's complement)
3) The least significant bit of the branch address in jalr is set to 0
4) (signed) Load instructions extend the sign bit of data to fill the 64-bit register
5) Replicates the sign bit to fill in the leftmost bits of the result during right shift
6) Multiply with one operand signed and one unsigned
7) The Single version does a single-precision operation using the rightmost 32 bits of a 64-bit F register
8) Classify writes a 10-bit mask to show which properties are true (e.g., –inf, -0,+0, +inf, denorm, ...)
9) Atomic memory operation; nothing else can interpose itself between the read and the write of the memory location

The immediate field is sign-extended in RISC-V
