CS61C Summer 2019 Discussion 1 – C Basics

1 C Introduction

C is syntactically very similar to Java, but there are a few key differences of which to be wary:

- C is function oriented, not object oriented, so there are no objects.
- C does not automatically handle memory for you.
 - In the case of stack memory (things allocated in the "usual" way), a datum is garbage immediately after the function in which it was defined returns.
 - In the case of heap memory (things allocated with malloc and friends), data is freed only when the programmer explicitly frees it.
 - In any case, allocated memory always holds garbage until it is initialized.
- C uses pointers explicitly. *p tells us to use the value that p points to, rather than the value of p, and &x gives the address of x rather than the value of x. See the following example (the following addresses were chosen aribitrarily). On the left we see a diagram of pointers and memory that may help you visualize pointers. On the right, we see how those "boxes and arrows" are really represented.

Let's assume that int* p is located at 0xF9320904 and int x is located at 0xF93209B0. As we can observe:

- *p should return 0x2A (42_{10}).
- p should return 0xF93209AC.
- x should return 0x61C.
- &x should return 0xF93209B0.

Let's say we have an int **pp that is located at 0xF9320900. What would pp return? How about *pp? What about **pp?

There are other differences in C of which you should be aware of, but this should be enough for you to get your feet wet.

2 Uncommented Code? Yuck!

The following functions work correctly (note: this does not mean intelligently), but have no comments. Document the code to prevent it from causing further confusion.

```
1. /* Returns the sum of the first N elements in ARR. */
  int foo(int *arr, size_t n) {
      return n ? arr[0] + foo(arr + 1, n - 1) : 0;
      /* Reminder syntax for ternary is: cond? true_result: false_result. */
  }
2. /* Returns -1 times the number of zeroes in the first N elements of ARR. */
  int bar(int *arr, size_t n) {
      int sum = 0, i;
      for (i = n; i > 0; i - -) {
          sum += !arr[i - 1];
          /* Assume ! of a true value is 0 and ! of a false value is 1. */
      }
      return ~sum + 1;
  }
3. /* Does nothing. */
  void baz(int x, int y) {
      x = x^{y};
      y = x ^ y;
      x = x^{y};
  }
```

3 Programming with Pointers

Implement the following functions so that they perform as described in the comments.

- 1. /* Swaps the value of two ints outside of this function. */
 void swap(int *x, int *y) {
 int temp = *x;
 *x = *y;
 *y = temp;
 }
 - 2. /* Increments the value of an int outside of this function by one. */

```
void plus_plus(int *x) {\
    (*x)++; // or: x[0]++;
}
```

3. /* Returns the number of bytes in a string. Does not use strlen. */

```
int mystrlen(char* str) {
    int count = 0;
    while(*str++) {
        count++;
    }
    return count;
}
```

4 Problem?

The following code segments may contain logic and syntax errors. Find and correct them.

```
1. /* Returns the sum of all the elements in SUMMANDS. */
  /* When iterating through a pointer in C it is
  * necessary to pass a size alongside the pointer. */
  int sum(int* summands) { // int sum(int* summands, unsigned int n) {
      int sum = 0;
      for (int i = 0; i < sizeof(summands); i++) // for (int i = 0; i < n; i++)</pre>
          sum += *(summands + i);
      return sum;
  }
2. /* Increments all the letters in the string STRING, held in an array of length N.
   * Does not modify any other memory which has been previously allocated. */
  /* The ends of strings are denoted by the null terminator.
  * Simply having space for n characters in the array does not
  * mean the array is of length n.*/
  void increment(char* string, int n) {
      for (int i = 0; i < n; i++) // for (i = 0; string[i] != 0; i++)</pre>
          *(string + i)++; // string[i]++; or (*(string + i))++;
  }
  /* Consider the corner case of incrementing 0xFF.
  * Adding 1 to 0xFF will overflow back to 0, producing
  * a null terminator and shortening the string. */
3. /* Copies the string SRC to DST. */
  void copy(char* src, char* dst) {
      while (*dst++ = *src++);
  }
  // This code has no errors.
4. /* Overwrites an inputted string with ''61C is awesome!'' if there's room.
   * Does nothing if there is not. Assume that srcLength correctly represents
   * the length of src. */
  void CS61C(char* src, size_t srcLength) {
```

```
char *srcptr, replaceptr; // char *srcptr, *replaceptr;
char replacement[16] = ''61C is awesome!'';
srcptr = src;
replaceptr = replacement;
if (srcLength >= 16) {
    for (int i = 0; i < 16; i++)
        *srcptr++ = *replaceptr++;
    }
}
// "char *srcptr, replaceptr" initializes a char pointer and a char.
// Not two char pointers.
// "char *srcptr, replaceptr" is not the same as "char *srcptr, *replaceptr".
```
