#### Lecture 11

#### **OUTLINE**

Cascode Stage

Reading: Chapter 9.1

### **Ideal Current Source**

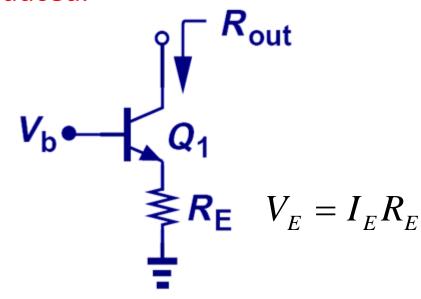

An ideal current source has infinite output impedance.

How can we increase the output impedance of a BJT that is used as a current source?

EE105 Spring 2008 Lecture 11, Slide 2 Prof. Wu, UC Berkeley

## **Boosting the Output Impedance**

- Recall that emitter degeneration boosts the impedance seen looking into the collector.
  - This improves the gain of the CE or CB amplifier. However, headroom is reduced.

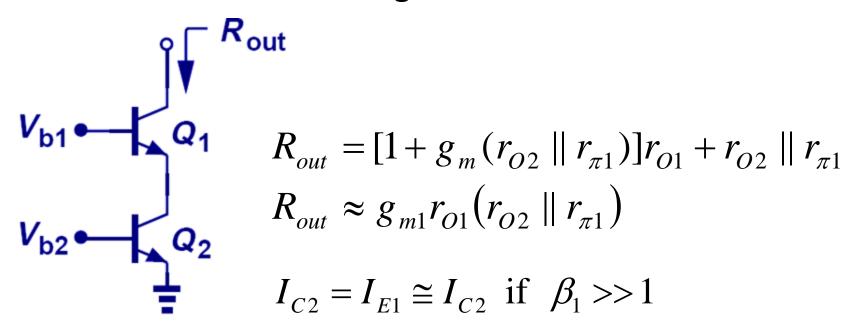

$$R_{out} = \left[1 + g_m(R_E \parallel r_\pi)\right]r_O + R_E \parallel r_\pi$$

EE105 Spring 2008 Lecture 11, Slide 3 Prof. Wu, UC Berkeley

### **Cascode Stage**

 In order to relax the trade-off between output impedance and voltage headroom, we can use a transistor instead of a degeneration resistor:

•  $V_{CE}$  for  $Q_2$  can be as low as ~ 0.4V ("soft saturation")

EE105 Spring 2008 Lecture 11, Slide 4 Prof. Wu, UC Berkeley

#### **Maximum Bipolar Cascode Output Impedance**

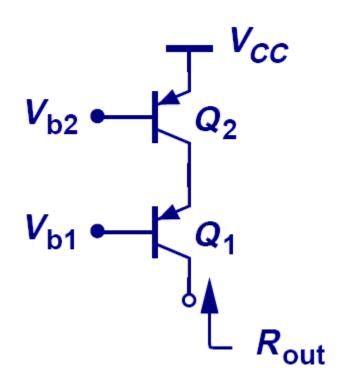

$$R_{out, \text{max}} \approx g_{m1} r_{01} r_{\pi 1}$$
  
 $R_{out, \text{max}} \approx \beta_1 r_{01}$ 

• The maximum output impedance of a bipolar cascode is bounded by the ever-present  $r_{\pi}$  between emitter and ground of  $Q_1$ .

EE105 Spring 2008 Lecture 11, Slide 5 Prof. Wu, UC Berkeley

### **PNP Cascode Stage**

$$R_{out} = [1 + g_m(r_{02} || r_{\pi 1})]r_{01} + r_{02} || r_{\pi 1}$$

$$R_{out} \approx g_{m1}r_{01}(r_{02} || r_{\pi 1})$$

EE105 Spring 2008 Lecture 11, Slide 6 Prof. Wu, UC Berkeley

### **False Cascodes**

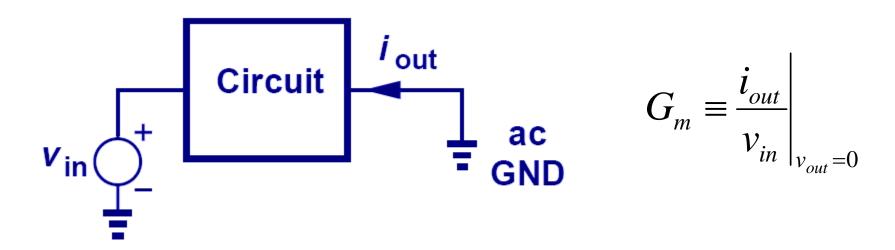

$$V_{b1} = \begin{bmatrix} V_{b1} & V_{b1} & V_{b2} &$$

• When the emitter of  $Q_1$  is connected to the emitter of  $Q_2$ , it's no longer a cascode since  $Q_2$  becomes a diodeconnected device instead of a current source.

EE105 Spring 2008 Lecture 11, Slide 7 Prof. Wu, UC Berkeley

#### **Short-Circuit Transconductance**

 The short-circuit transconductance of a circuit is a measure of its strength in converting an input voltage signal into an output current signal.

EE105 Spring 2008 Lecture 11, Slide 8 Prof. Wu, UC Berkeley

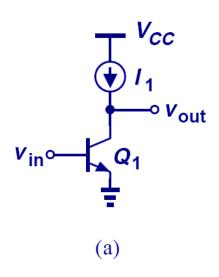

### **Voltage Gain of a Linear Circuit**

 By representing a linear circuit with its Norton equivalent, the relationship between V<sub>out</sub> and V<sub>in</sub> can be expressed by the product of G<sub>m</sub> and R<sub>out</sub>.

(b)

### **Example: Voltage Gain**

$$G_m \equiv \frac{i_{out}}{v_{in}}\bigg|_{v_{out}=0} = g_{m1}$$

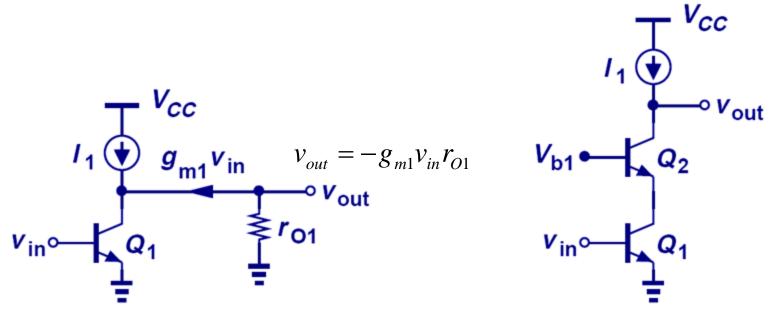

$$v_{\text{in}} \circ \qquad \qquad \downarrow \qquad \qquad$$

$$R_{out} \equiv \frac{v_x}{i_x} = r_{o1}$$

$$A_{v} = -g_{m1}r_{01}$$

# **Comparison of CE and Cascode Stages**

• Since the output impedance of the cascode is higher than that of a CE stage, its voltage gain is also higher.

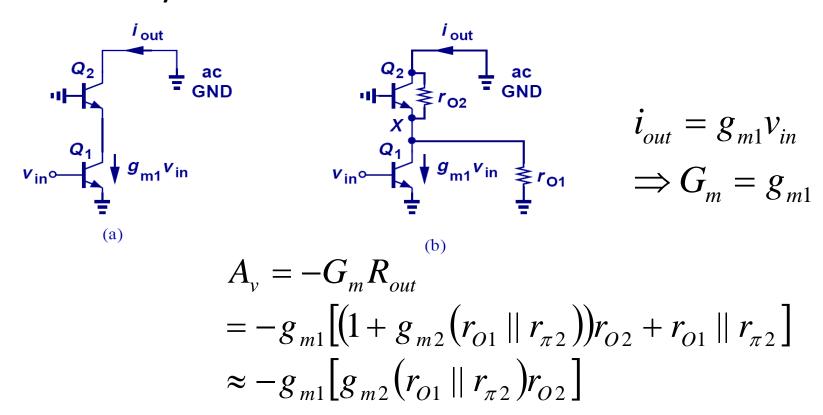

$$A_{v} = -g_{m1}r_{O1} = -\frac{V_{A}}{V_{T}} \qquad A_{v} \approx -g_{m1}r_{O2}g_{m2}(r_{O1}||r_{\pi 2})$$

EE105 Spring 2008 Lecture 11, Slide 11 Prof. Wu, UC Berkeley

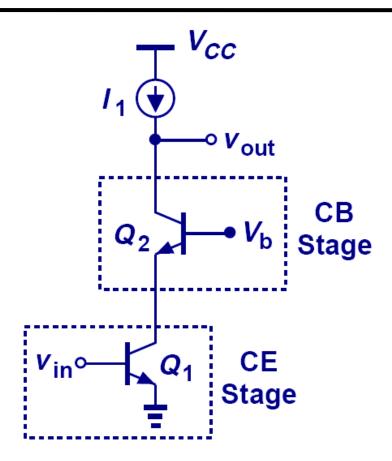

## **Voltage Gain of Cascode Amplifier**

• Since  $r_0$  is much larger than  $1/g_m$ , most of  $I_{C,Q1}$  flows into diode-connected  $Q_2$ . Using  $R_{out}$  as before,  $A_V$  is easily calculated.

EE105 Spring 2008 Lecture 11, Slide 12 Prof. Wu, UC Berkeley

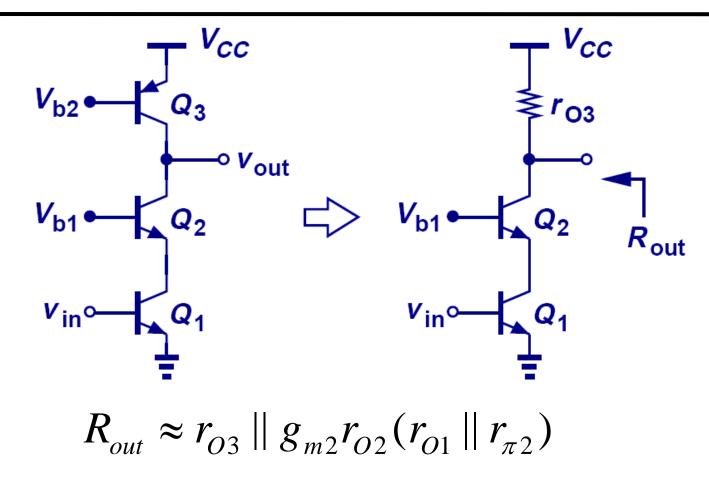

## **Alternate View of Cascode Amplifier**

 A bipolar cascode amplifier is also a CE stage in series with a CB stage.

EE105 Spring 2008 Lecture 11, Slide 13 Prof. Wu, UC Berkeley

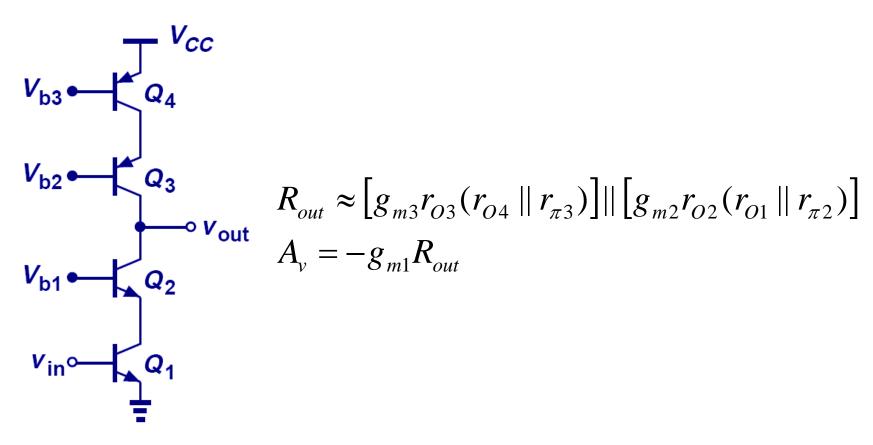

## **Practical Cascode Stage**

 Since no current source can be ideal, the output impedance drops.

EE105 Spring 2008 Lecture 11, Slide 14 Prof. Wu, UC Berkeley

# **Improved Cascode Stage**

 In order to preserve the high output impedance, a cascode PNP current source is used.

EE105 Spring 2008 Lecture 11, Slide 15 Prof. Wu, UC Berkeley
