

Figure 1: Reservoir pumps system.

- Write out the transition matrix  $\mathbf{T}$  representing the pumps system.
- You are told that  $\lambda_1 = 1$ ,  $\lambda_2 = \frac{-\sqrt{2}-1}{10}$ ,  $\lambda_3 = \frac{\sqrt{2}-1}{10}$  are the eigenvalues of  $\mathbf{T}$ . Find a steady state vector  $\vec{x}$ , i.e. a vector such that  $T\vec{x} = \vec{x}$ .
- What does the magnitude of the other two eigenvalues  $\lambda_2$  and  $\lambda_3$  say about the steady state behavior of their associated eigenvectors?
- Assuming that you start the pumps with the water levels of the reservoirs at  $A_0 = 129$ ,  $B_0 = 109$ ,  $C_0 = 0$  (in kiloliters), what would be the steady state water levels (in kiloliters) according to the pumps system described above?
