

To do : SVD basics & intuition

- ① Motivation
- ② Spectral Theorem
- ③ Computing the SVD
- ④ Conceptualizing SVD

Motivation : Fundamental in many aspects of EECS
 $\left\{ \begin{array}{l} \text{PCA} \\ \text{ML} \\ \text{clarification} \\ \text{etc.} \end{array} \right.$

Spectral Theorem : Any symmetric matrix is orthogonally diagonalizable

- Symmetric Matrix : $A = A^T$ e.g. $\begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$
- Orthogonally diagonalizable : $A = V \Lambda V^T$
 - eigenvector of A
 - the eigenvectors are mutually orthogonal and have a norm of 1

I can create a symmetric matrix from any given matrix A via $\begin{cases} AA^T \\ A^T A \end{cases}$

→ eigenvalues of $A^T A / AA^T$ are non negative ($\lambda_i \geq 0$)

Quick Proof

Let \vec{v} be the eigenvector of $A^T A$

$$\begin{aligned} \therefore A^T A \vec{v} &= \lambda \vec{v} \\ \left(\begin{matrix} \vec{v}^T & A^T \end{matrix} \right) A \vec{v} &= \vec{v}^T \lambda \vec{v} \end{aligned} \quad \left. \begin{array}{l} \\ \end{array} \right\} \text{Multiply } \vec{v}^T \text{ both sides}$$

$$(A\vec{v})^T A\vec{v} = \lambda \vec{v}^T \vec{v}$$

$$\therefore (AB)^T = B^T A^T$$

Recall: $\|\vec{x}\|_2^2 = \vec{x}^T \vec{x}$ [Monday's Dine]

$$\therefore \|A\vec{v}\|_2^2 = \lambda \|\vec{v}\|_2^2$$

$$\therefore \lambda = \frac{\|A\vec{v}\|_2^2}{\|\vec{v}\|_2^2} \geq 0 \quad \text{because the norms of vectors are always } \geq 0$$

Check if $A^T A = (A^T A)^T$

$$= A^T \cdot (A^T)^T = A^T A \quad \checkmark \therefore A^T A \text{ is symmetric}$$

Steps to computing SVD: $A = U \Sigma V^T$

① Understand dimensionally what matrix size each component is.

$$A = \begin{matrix} & U & \Sigma & V^T \\ \text{m} \times \text{n} & \swarrow & \downarrow & \searrow \\ & \text{m} \times \text{m} & \text{m} \times \text{n} & \text{n} \times \text{n} \end{matrix} \quad \text{[full form SVD]}$$

① Pick $A^T A$ or AA^T

② If $A^T A$, find the eigenvectors of $A^T A$ and order them:

$$A^T A \vec{v}_i = \lambda_i \vec{v}_i, \quad i = 1 \text{ to } r$$

$$\text{for } \lambda_1 \geq \dots \geq \lambda_r \geq 0 \quad r = \text{rank}(A)$$

\vec{v}_i form forms the V basis

If AA^T , find the eigenvector of AA^T " " "

$$\rightarrow AA^T \vec{u}_i = \lambda_i \vec{u}_i$$

$\therefore \vec{u}_i$ forms the U matrix

③ $\sigma_i = \sqrt{\lambda_i}$

④ If $A^T A$, obtain \vec{u}_i from $\vec{u}_i = \frac{1}{\sigma_i} A \vec{v}_i, \quad i = 1 \text{ to } r$

If AA^T , obtain \vec{v}_i from $\vec{v}_i = \frac{1}{\sigma_i} A^T \vec{u}_i, \quad i = 1 \text{ to } r$

★ ⑤ To completely reconstruct U or V , you need to G-S. with appropriate basis vectors to get full matrix

Form of SVD

- ① Full Form $A = U \Sigma V^T$
- ② Compact Form $A = U_r \Sigma_r V_r^T$, $r = \text{rank}(A)$
- ③ Outer Product Form $A = \sum_{i=1}^r \sigma_i u_i \vec{v}_i^T$

Q1: $A = \begin{pmatrix} 1 & -1 \\ -2 & 2 \\ 2 & -2 \end{pmatrix} = U \Sigma V^T$, $\text{rank}(A) = 1$

$\begin{matrix} \downarrow & \downarrow & \downarrow \\ 3 \times 3 & 3 \times 2 & 2 \times 2 \end{matrix}$

(a) (i) $A^T A = \begin{bmatrix} 9 & -9 \\ -9 & 9 \end{bmatrix}$ $\lambda_1 = 18 \rightarrow \vec{v}_1 = \begin{bmatrix} -1/\sqrt{2} \\ 1/\sqrt{2} \end{bmatrix}$
 $\lambda_2 = 0 \rightarrow \vec{v}_2 = \begin{bmatrix} 1/\sqrt{2} \\ 1/\sqrt{2} \end{bmatrix}$

(ii) Unpack $V = [V_r, V_{n-r}] \rightarrow V_{n-r} = \begin{bmatrix} 1/\sqrt{2} \\ 1/\sqrt{2} \end{bmatrix}$
 $V_r = \vec{v}_1 = \begin{bmatrix} -1/\sqrt{2} \\ 1/\sqrt{2} \end{bmatrix}$

Unpack $\Lambda \rightarrow \Lambda_r = \text{diagonal matrix of } \sqrt{\lambda_i} \text{ for } i=1 \text{ to } r$

$\therefore \Lambda_r = [18]$

(iii) $\Sigma_r = \lambda_r^{1/2} = [\sqrt{18}]$

$\Sigma = \begin{bmatrix} \sqrt{18} & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$ (fill in 0s such that dimensionally matches with A)

(iv) $U_r = A V_r \Sigma_r^{-1} = \begin{bmatrix} -1/3 \\ 2/3 \\ -2/3 \end{bmatrix}$

\therefore Construct U using gram-schmidt

$\begin{bmatrix} -1/3 & 1 & 0 & 0 \\ 2/3 & 0 & 1 & 0 \\ -2/3 & 0 & 0 & 1 \end{bmatrix} \xrightarrow{\text{G.S.}} \begin{bmatrix} -1/3 & \sqrt{8}/3 & 0 & 0 \\ 2/3 & 1/3\sqrt{2} & 1/\sqrt{2} & 0 \\ -2/3 & -1/3\sqrt{2} & 1/\sqrt{2} & 0 \end{bmatrix}$

U

$$(v) A = U \Sigma V^T = \begin{matrix} 3 \times 2 \\ \begin{bmatrix} -\frac{1}{3} & \frac{\sqrt{6}}{3} & 0 \\ \frac{2}{3} & \frac{1}{3\sqrt{2}} & \frac{1}{\sqrt{2}} \\ -\frac{2}{3} & -\frac{1}{3\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \end{matrix} \begin{matrix} \begin{bmatrix} \sqrt{6} & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \\ 3 \times 2 \end{matrix} \begin{matrix} \begin{bmatrix} -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix}^T \\ 2 \times 2 \end{matrix}$$

$$A = U_r \Sigma_r V_r^T$$

$$\begin{matrix} 3 \times 2 \\ \begin{bmatrix} -\frac{1}{3} \\ \frac{2}{3} \\ -\frac{2}{3} \end{bmatrix} \end{matrix} \begin{matrix} \begin{bmatrix} \sqrt{6} \end{bmatrix} \\ 1 \times 1 \end{matrix} \begin{matrix} \begin{bmatrix} -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \\ 1 \times 2 \end{matrix} \rightarrow 3 \times 2 \text{ (compact form)}$$

$$(b) A = U \Sigma V^T$$

$$A^T = (U \Sigma V^T)^T = V \Sigma^T U^T$$

$$\begin{matrix} 2 \times 3 \\ \begin{bmatrix} -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix} \end{matrix} \begin{matrix} \begin{bmatrix} \sqrt{6} & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \\ 2 \times 3 \end{matrix} \begin{matrix} \begin{bmatrix} -\frac{1}{3} & \frac{\sqrt{6}}{3} & 0 \\ \frac{2}{3} & \frac{1}{3\sqrt{2}} & \frac{1}{\sqrt{2}} \\ -\frac{2}{3} & -\frac{1}{3\sqrt{2}} & \frac{1}{\sqrt{2}} \end{bmatrix}^T \\ 3 \times 3 \end{matrix}$$

$$(c) \text{Null}(A) = \text{Col}(V_{n-r})$$

$$\text{We can write } A = \sum_{i=1}^r \sigma_i u_i v_i^T$$

$$\text{Null}(A) \text{ means } A\vec{x} = \vec{0}, \vec{x} \neq \vec{0}$$

$$A\vec{x} = \sum_{i=1}^r \sigma_i u_i \underline{v_i^T \vec{x}}$$

→ What vector of \vec{x} makes $\underline{v_i^T \vec{x}} = 0$?
→ orthogonal vector to $\underline{v_i}$

∴ \vec{x} to be \perp to $\underline{v_i}$ for $i=1$ to r

∴ $\vec{x} \in \text{Col}(V_{n-r}) \rightarrow V$ is orthonormal

$$\begin{bmatrix} V_r, V_{n-r} \end{bmatrix}$$

orthogonal
to V_r

$$\therefore \text{Null}(A) = \text{Col}(V_{n-r})$$

$$(d) \text{Col}(A) = \text{Col}(U_r)$$

$$A = \sum_{i=1}^r \sigma_i u_i \underline{v_i^T}$$

$\text{Col}(A)$ means that for a given vector \vec{b} , $A\vec{x} = \vec{b}$

$$\therefore A\vec{x} = \sum_{i=1}^r \beta_i \vec{u}_i \underbrace{\vec{v}_i^T \vec{x}}_{\neq 0, \vec{v}_i^T \vec{x} \text{ is a scalar}}$$

$$= \sum_{i=1}^r (\vec{v}_i^T \vec{x}) \beta_i \vec{u}_i$$

$$= \sum_{i=1}^r \alpha_i \vec{u}_i \Rightarrow \text{linear combination of } \vec{u}_1, \vec{u}_2, \dots, \vec{u}_r$$

$$\therefore \vec{b} \in \text{Col}(U_r) \therefore A\vec{x} \in \text{Col}(U_r)$$

$$\therefore \text{Col}(A) = \text{Col}(U_r) \quad \therefore \vec{b} \in \text{Col}(A)$$

$$\therefore \text{Col}(A) = \text{Col}(U_r)$$

(f) AA^T

$$r = \text{rank}(A)$$

$(U, \Lambda) = \text{diagonalize}(AA^T)$

$$\text{Unpack } \Lambda = \begin{bmatrix} \Lambda_r & 0_{r \times (m-r)} \\ 0_{(m-r) \times r} & 0_{(m-r) \times (m-r)} \end{bmatrix}$$

$$\Sigma_r = \Lambda_r^{1/2}$$

pack Σ

$$V_r = A^T U_r \Sigma_r^{-1}$$

$$V = \text{extend basis}(V_r, \mathbb{R}^n)$$

return (U, Σ, V)
