1. Eigenvalue Placement in Discrete Time

Recall that, for a discrete linear system to be stable, we require that all of the eigenvalues of A in $\vec{x}[i+1] = A\vec{x}[i] + B\vec{u}[i]$ must have magnitude less than 1.

Consider the following linear discrete time system

$$\vec{x}[i+1] = \begin{bmatrix} 0 & 1\\ 2 & -1 \end{bmatrix} \vec{x}[i] + \begin{bmatrix} 1\\ 0 \end{bmatrix} u[i] + \vec{w}[i]$$
(1)

(a) Is the system given in eq. (1) stable?

$$\left[\lambda_{1} \right] \left[\left(\begin{array}{c} 1 \\ 2 \end{array}\right)^{-1} \right] - \left(\begin{array}{c} \lambda \\ 0 \end{array}\right)^{-1} \right] = det \left(\left(\begin{array}{c} -\lambda \\ 2 \end{array}\right)^{-1} \right) \right]$$

$$dut \left(\left(A \rightarrow \overline{x} \right)^{-2} \right) = \lambda \left(1 + \lambda \right) - 2$$

$$= \lambda^{1} + \lambda - 2$$

$$= \left(\lambda + 2 \right) \left(\lambda^{-1} \right) = 0$$

$$= \lambda \left(z - 2 \right)^{-1}$$

(b) We can attempt to stabilize the system by implementing closed loop feedback. That is, we choose our input u[i] so that the system is stable. If we were to use state feedback as in eq. (2), what is an equivalent representation for this system? Write your answer as $\vec{x}[i+1] = A_{CL}\vec{x}[i]$ for f^{\dagger} some matrix A_{CL} .

$$u[i] \neq \begin{bmatrix} f_1 & f_2 \end{bmatrix} \bar{\mathbf{x}}[i] \tag{2}$$

.

HINT: If you're having trouble parsing the expression for u[i], note that $\begin{bmatrix} f_1 & f_2 \end{bmatrix}$ is a row vector, while $\vec{x}[i]$ is column vector. What happens when we multiply a row vector with a column vector like this?)

$$\begin{aligned} x(i+i) &= A \times \{i\} + B \cdot q(i) \\ &= A \times \{i\} + B \cdot f^{T} \times \{i\} \\ &= \begin{bmatrix} \circ & 1 \\ 2 & -1 \end{bmatrix} \times [i] + \begin{bmatrix} 1 \\ 0 \end{bmatrix} \begin{bmatrix} f_{i} & f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} \circ & i \\ 2 & -1 \end{bmatrix} \times [i] + \begin{bmatrix} f_{i} & f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} 0 & i \\ 2 & -1 \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} & 1 \cdot f_{i} \end{bmatrix} \times [i] \\ &= \begin{bmatrix} f_{i} &$$

(c) Find the appropriate state feedback constants, f_1, f_2 , that place the eigenvalues of the state space representation matrix at $\lambda_1 = -\frac{1}{2}$, $\lambda_2 = \frac{1}{2}$.

$$\begin{aligned} \chi(i+1) &= \begin{pmatrix} f_i & 1+f_1 \\ 2 & -1 \end{pmatrix} \chi(i) \\ & \mathcal{A}_{L} \\ det(\mathcal{A}_{LL} - \lambda \Sigma) &= det(\begin{pmatrix} f_i & 1+f_2 \\ 2 & -1 \end{pmatrix} - \begin{pmatrix} \lambda & 0 \\ 0 & \lambda \end{pmatrix}) \\ &= det(\begin{pmatrix} f_i - \lambda & 1+f_2 \\ 2 & -1+\lambda \end{pmatrix}) \\ &= det(\begin{pmatrix} f_i - \lambda & 1+f_2 \\ 2 & -1+\lambda \end{pmatrix}) \\ &= (\lambda - f_i)(\lambda - 1) - 2(1 + f_2) \\ &= (\lambda - f_i)(\lambda - 1) - 2(1 + f_2) \\ &= \lambda^2 + (1 + f_i)\lambda - f_i - 2(1 + f_2) \\ &= \lambda^2 + (1 + f_i)\lambda - f_i - 2(1 + f_2) \\ &= \lambda^2 + (1 + f_i)\lambda - f_i - 2(1 + f_2) \\ &= \lambda^2 + (1 + f_i)\lambda - f_i - 2(1 + f_2) \\ &= (\lambda - f_i)(\lambda - f_i) - 2f_1 + \lambda^2 + e(\lambda + \beta) \\ &= (1 - f_i) = 0 \\ -f_i - 2 - 2f_2 = -\frac{y_i}{y_i} \\ &= (\frac{1}{3} e^{j - \frac{y_i}{y_j}} = (\frac{1}{3}) e^{j - \frac{y_i}{y_j}} = \frac{y_j}{y_i} \end{aligned}$$

- (d) Is the system now stable in closed-loop, using the control feedback coefficients f_1, f_2 that we derived above?
- (e) Suppose that instead of $\begin{bmatrix} 1 \\ 0 \end{bmatrix} u[i]$ in eq. (1), we had $\begin{bmatrix} 1 \\ 1 \end{bmatrix} u[i]$ as the way that the discrete-time control acted on the system. In other words, the system is as given in eq. (3).

$$\vec{x}[i+1] = \begin{bmatrix} 0 & 1 \\ 2 & -1 \end{bmatrix} \vec{x}[i] + \begin{bmatrix} 3 \\ 1 \\ 1 \end{bmatrix} u[i] \qquad \stackrel{\checkmark \ 9}{(2^{x})(2^{x})(2^{x})} \xrightarrow{\neg} (2^{x}) \qquad (3)$$

Determine whether the system is controllable or not.

in the whether the system is controllable or not.
a system is controllable of
$$\begin{bmatrix} 0 & 1 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix}$$

$$C = a f - 1 f - ank$$

full rank => lin, ind. columns

(f) Let's say we still try and apply closed loop feedback to our system. Let's use $u[i] = \begin{bmatrix} f_1 & f_2 \end{bmatrix} \vec{x}[i]$ to try and control the system. Show that the resulting closed-loop state space matrix is

$$A_{\rm CL} = \begin{bmatrix} f_1 & f_2 + 1\\ f_1 + 2 & f_2 - 1 \end{bmatrix}$$
(4)

Is it possible to stabilize this system?

$$det (A_{ll} - \lambda I) = det \left(\begin{bmatrix} f_{l} & f_{l} + f_{l} \\ f_{l} + 2 & f_{l} - l \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} \right)$$

$$= det \left(\begin{bmatrix} f_{l} - \lambda & f_{l} + l \\ f_{l} + 2 & f_{l} - l - \lambda \end{bmatrix} \right)$$

$$= (f_{l} - \lambda) (f_{l} - (-\lambda) - (f_{l} + 2) (f_{l} - 1))$$

$$= \left[f_{l} f_{l} - f_{l} - f_{l} \lambda - f_{l} \lambda + \lambda + \lambda^{2} \right] - \left[f_{l} f_{l} + f_{l} + 2f_{l} + \lambda \right]$$

$$= \lambda^{2} + (1 - f_{l} - f_{l}) \lambda + \frac{f_{l} f_{l}}{f_{l} - f_{l}} - \frac{f_{l}}{f_{l}} - \frac{f_{l}}{$$

2. Uncontrollability

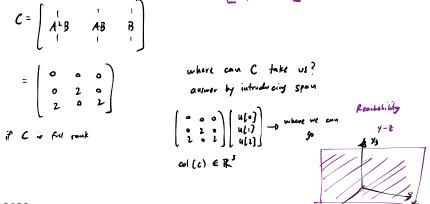

Recall that, for a *n*-dimensional, discrete-time linear system to be controllable, we require that the controllability matrix $C = \begin{bmatrix} A^{n-1}B & A^{n-2}B & \dots & AB & B \end{bmatrix}$ to be rank *n*.

Consider the following discrete-time system with the given initial state:

$$\vec{x}[i+1] = \begin{bmatrix} 2 & 0 & 0 \\ -3 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \vec{x}[i] + \begin{bmatrix} 0 \\ 0 \\ 2 \end{bmatrix} u[i]$$
(5)
$$\vec{x}[0] = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$
(6)

(a) Is the system controllable?

 $\begin{array}{c} A \cdot A \cdot B \\ (3 \times 3)(3 \times 3)(3 \times 1) \\ (3 \times 1) \\ (3$

3

(b) Show that we can write the *i*th state as

$$\vec{x}[i] = \begin{bmatrix} 2^i \\ -3x_1[i-1] + x_3[i-1] \\ x_2[i-1] + 2u[i-1] \end{bmatrix}$$
(7)

Is it possible to reach $\vec{x}[\ell] = \begin{bmatrix} -2 \\ 4 \\ 6 \end{bmatrix}$ for some ℓ ? If so, for what input sequence u[i] up to $i = \ell - 1$?

$$\vec{\mathbf{x}} [\vec{\mathbf{x}}] = \left(\begin{array}{c} \mathbf{x}_{1} [\vec{\mathbf{x}}] \\ \mathbf{x}_{2} [\vec{\mathbf{x}}] \\ \mathbf{x}_{3} [\vec{\mathbf{x}}] \end{array} \right)$$

HINT: Use the result for $\vec{x}[i]$ *from the previous part.*

(d) Find the set of all $\vec{x}[2]$, given that you are free to choose any u[0] and u[1].
