## Final Part 1

(1) This is a preview of the published version of the quiz

Started: Jan 27 at 6:50pm

## **Quiz Instructions**

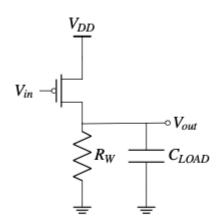

The final is open book. You are allowed to use any lecture/course notes, homeworks, discussions, or websites (except those for collaborative documents or forums). In addition to this, we will allow the use of a calculator and a Python File or Notebook. You may not access or post on any collaborative documents (e.g. Google Docs) or forums (e.g. Chegg). Collaboration with other students is prohibited.

Assuming you do not have an approved time extension, you will have 40 minutes to complete this part of the final. You may start this part anytime in the hour window given. However this part will close at the end of the hour, meaning that you must start within the first 20 minutes to have the full 40 minute time for this part. We are not Zoom proctoring.

Please look at the important notes here before starting: https://piazza.com/class/ke609ylh5ap5uv?cid=1313 (https://piazza.com/class/ke609ylh5ap5uv?cid=1313)

We will not clarify anything during the exam so please do your best with the information provided. If you have an issue during your exam please email us at eecs16b-fa20@berkeley.edu and CC the professors (seth.sanders@berkeley.edu and <u>mlustig@eecs.berkeley.edu</u>). (mailto:mlustig@eecs.berkeley.edu).) Good luck!

Taejin is trying to build an inverter to power up a clock. He considers the following two designs using NMOS and PMOS transistors shown below.

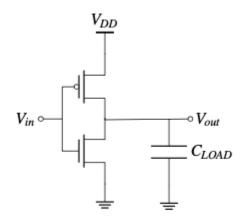

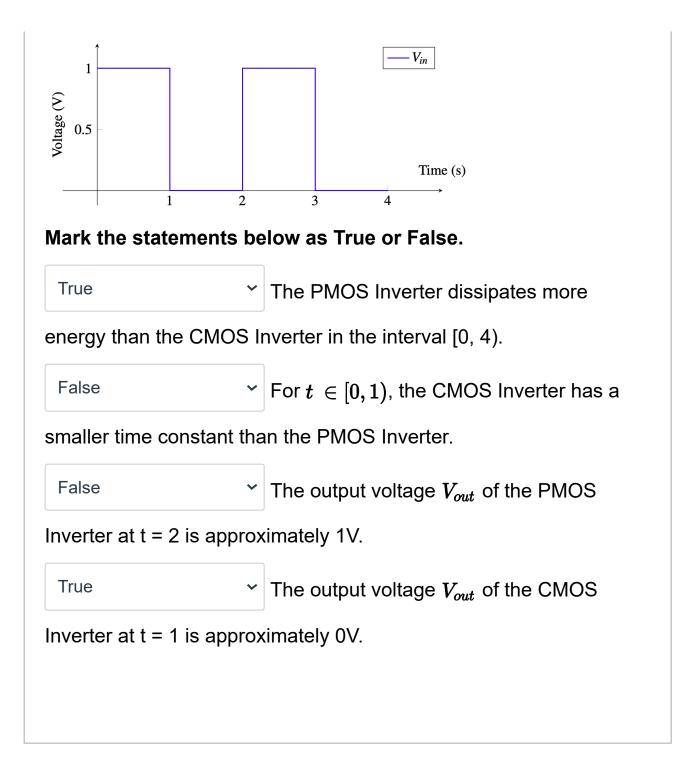

Figure 1: Single PMOS Model

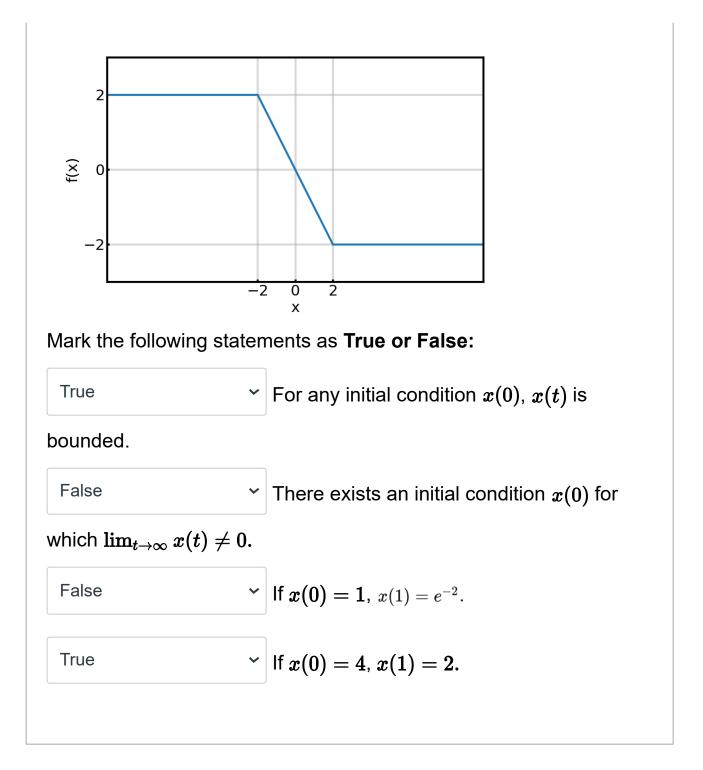

Both models contain an output load capacitance  $C_{LOAD}$ . In addition, the PMOS inverter model contains a pull-down resistor  $R_W = 500\Omega$ . All PMOS and NMOS transistors follow the resistor-switch model with switch resistance  $R_{NMOS} = R_{PMOS} = 1k\Omega$  and have threshold voltage  $|V_{th}| = 0.7V$ . All PMOS and NMOS devices have negligible gate capacitance.

Assume that  $V_{DD} = 1V$ , and that at time t = 0, the output voltage  $V_{out}(0) = 1V$ . To test the models, Taejin applies a square wave input  $V_{in}$  to both circuits shown below.

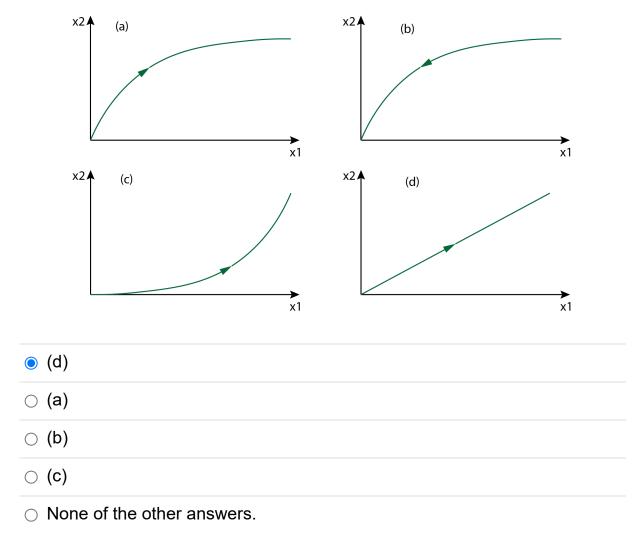

Question 2	1 pts
Consider the first order differential equation $\frac{d}{dt}x(t) = f(x),$ where the function $f(x)$ is as shown in the graph below.	

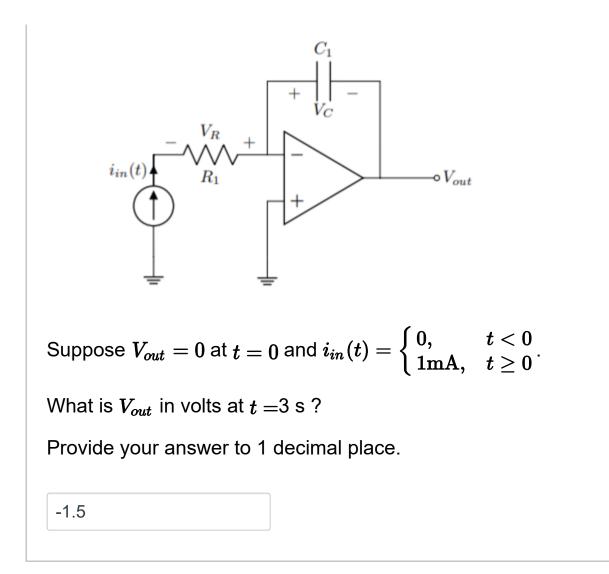

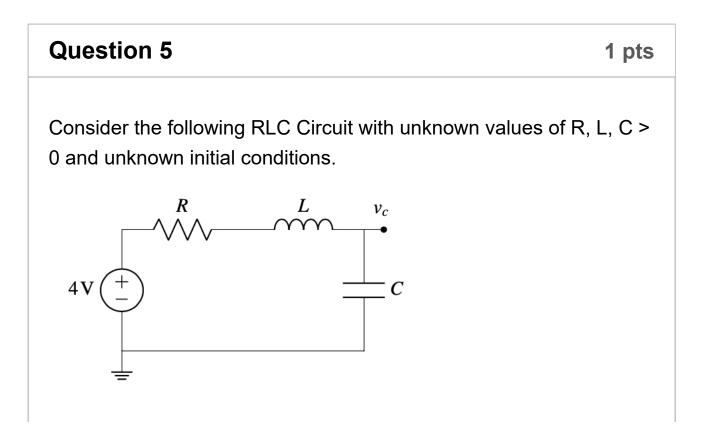

# Question 31 ptsConsider the following dynamical system with control input $u \in \mathbb{R}$ <br/>and state vector $\vec{x} \in \mathbb{R}^2$ :<br/> $\frac{d}{dt}\vec{x}(t) = A\vec{x}(t) + \vec{v}_1 u(t)$

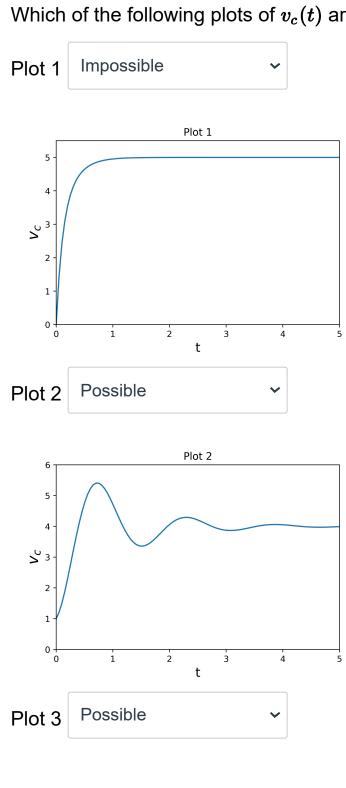

Where  $A \in \mathbb{R}^{2 \times 2}$  and  $\vec{v}_1 \in \mathbb{R}^2$  is an eigenvector of A. Suppose  $\vec{x}(0) = \vec{0}$ , and u is held constant at 1. Which of the following graphs could represent the evolution of the components of  $\vec{x}(t)$  as time proceeds?

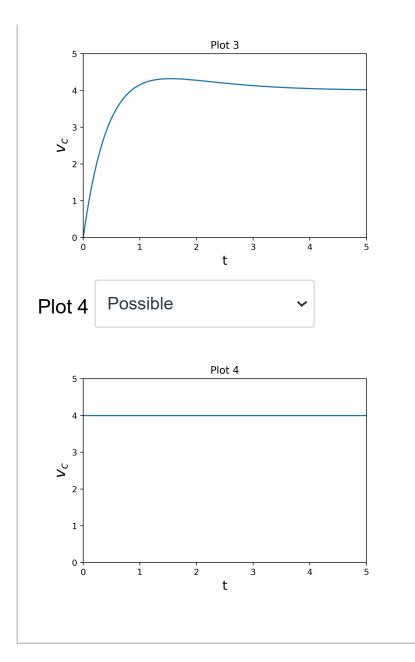

Question 4	1 pts
Consider the following circuit with $R_1 = 100 \ \Omega$ , $C_1 = 2 \ \mathrm{mF}$ , ideal op-amp. You may assume the op-amp power supplies constrain $V_{out}$ .	

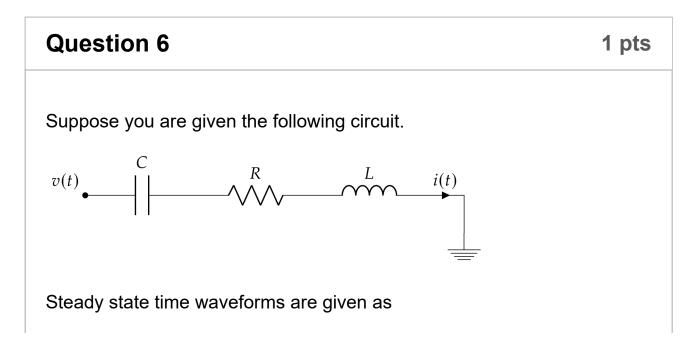

## Which of the following plots of $v_c(t)$ are **possible?**

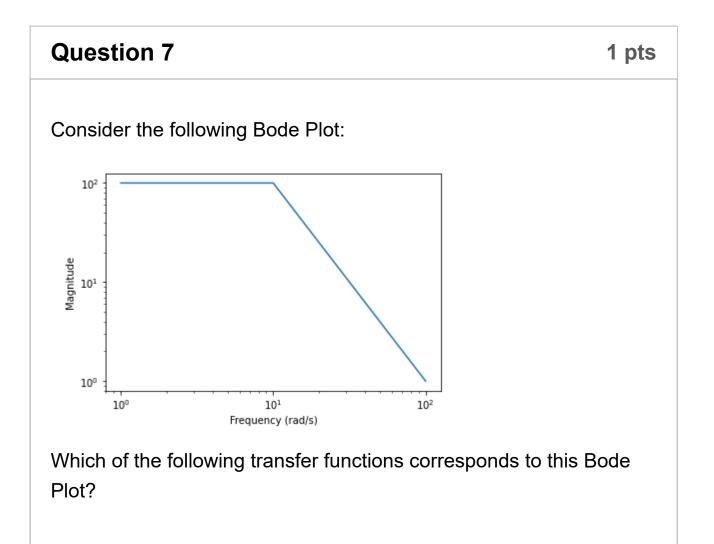

$$egin{aligned} v(t) &= 4\cos(\omega t)\ i(t) &= 2\cos(\omega t - \pi/6) \end{aligned}$$

where the respective units are Volts and Amperes,

$$\omega=2 imes 10^6 {
m rad/s}, R=\sqrt{3}\Omega, C=0.5 \mu F_{\odot}$$

What is the inductance of the inductor?

$\bigcirc 5 \mu H$	
$\bigcirc 2 \mu H$	
$ullet$ 1 $\mu H$	
$\bigcirc 0.5 \mu H$	

$_{(a):} H(j\omega) = rac{100}{rac{j\omega}{10}+1}$	
(b): $H(j\omega)=rac{100}{\left(rac{j\omega}{10}+1 ight)^2}$	
$_{(C):} H(j\omega) = rac{10}{rac{j\omega}{100}+1}$	
(d): $H(j\omega) = rac{10}{\left(rac{j\omega}{1}+1 ight)^2}$	
● (b)	
○ (a)	
○ (c)	
○ (d)

1 pts

Consider the following system

$$egin{aligned} rac{dx_1}{dt} &= \sin(\pi x_2) - x_1, \ rac{dx_2}{dt} &= x_1 - x_2. \end{aligned}$$

Select the **correct** statement regarding this system's equilibrium points.

- System has exactly 3 equilibrium points.
- System has infinitely many equilibrium points.
- $\bigcirc$  System has exactly one equilibrium.

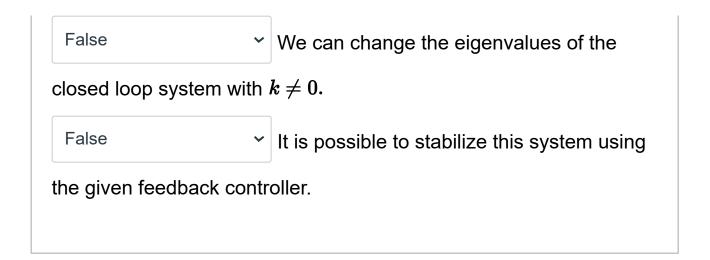

Consider the following non-linear continuous time system.

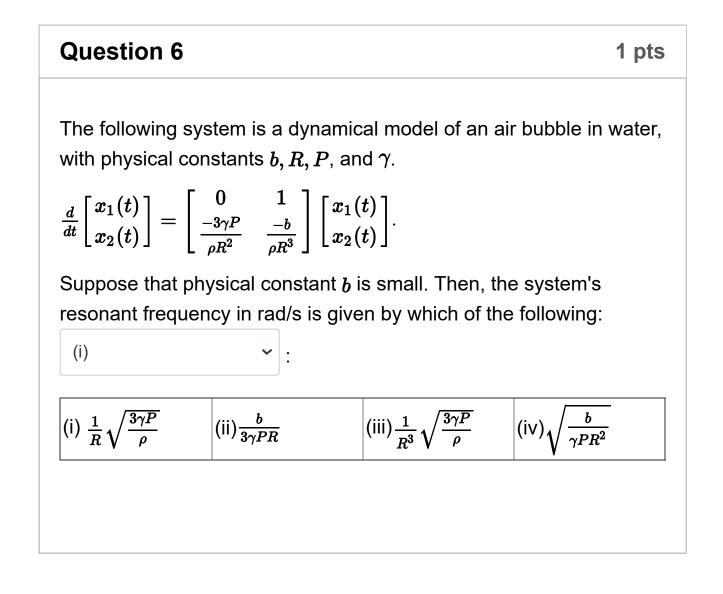

$$egin{aligned} rac{dx(t)}{dt} &= (1-y(t))x(t)+u(t)\ rac{dy(t)}{dt} &= (x(t)-y(t))y(t) \end{aligned}$$

Linearize the non-linear system around the equilibrium (assuming  $u^*=0$  ) of the form  $(x^*,y^*),\ x^*>0,\ y^*>0.$ 

The linearized system is	Stable	≁.
The linearized system is	Controllable	✓.

Question 51 ptsWe have the following continuous time system
$$\frac{d}{dt} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 0 & 2 \\ 2 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} -1 \\ 1 \end{bmatrix} u(t)$$
We are trying to use a single-parameter feedback controller $u(t) = k (x_1(t) + x_2(t))$ . Which of the following statements areTrue?False  $\checkmark$  For  $k = 0$  the system is stable.

Professor Sanders shoots a video of Professor Lustig's car racing down Sather Gate. When the car is moving forward, its wheels turn in a counterclockwise motion.

However upon watching the video, Archit notices that the car's wheels appear to be moving clockwise at a rate of 2 rev/s. Given that the video is shot at 30 frames per second, and the car's wheels each have 5 identical uniformly spaced spokes, mark all of the possible rates at which the car's wheels could possibly have been moving.

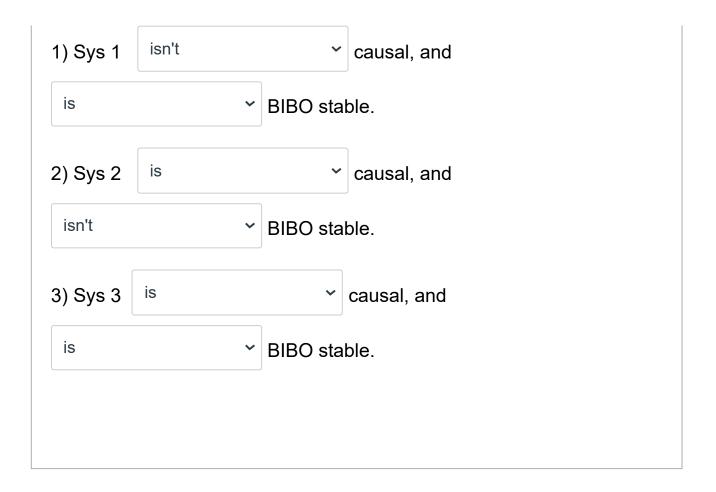

- 8 rev/s clockwise
- □ 2 rev/s counterclockwise
- 10 rev/s counterclockwise
- 4 rev/s counterclockwise

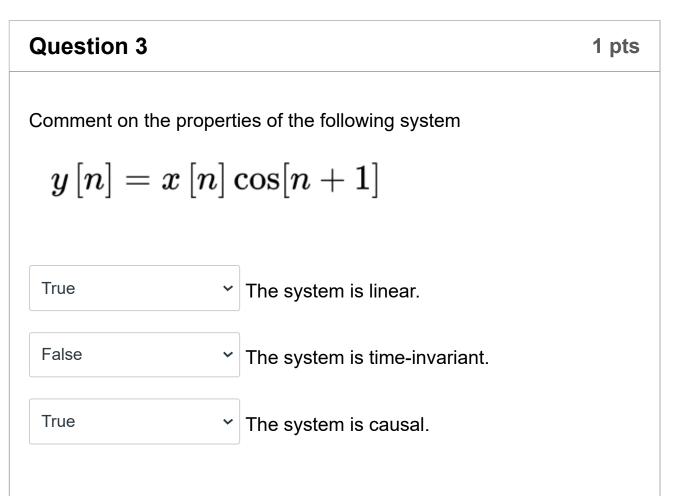

#### **Question 2**

1 pts

You are given 3 LTI systems with the following impulse responses:

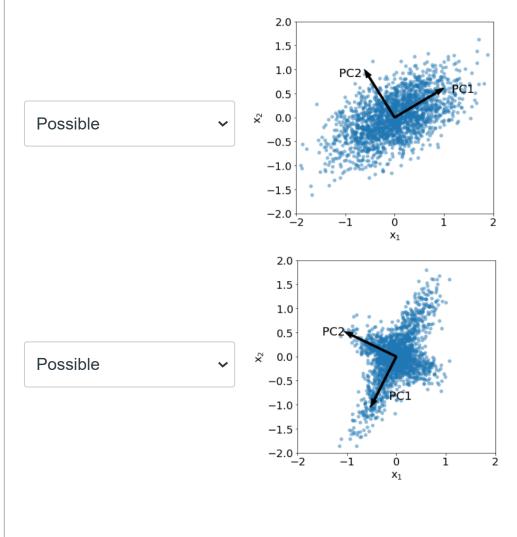

Sys 1:  $h_1[n] = \delta[n-4] - \delta[n+4]$ Sys 2:  $h_2[n] = U[n-4]$  (U[n] is a unit step function) Sys 3:  $h_3[n] = h_2[n] * h_1[n]$  (the symbol \* notes a discrete convolution)

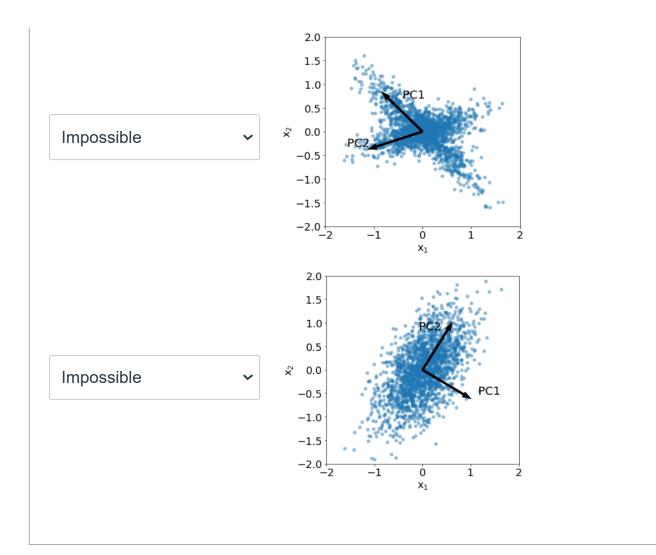

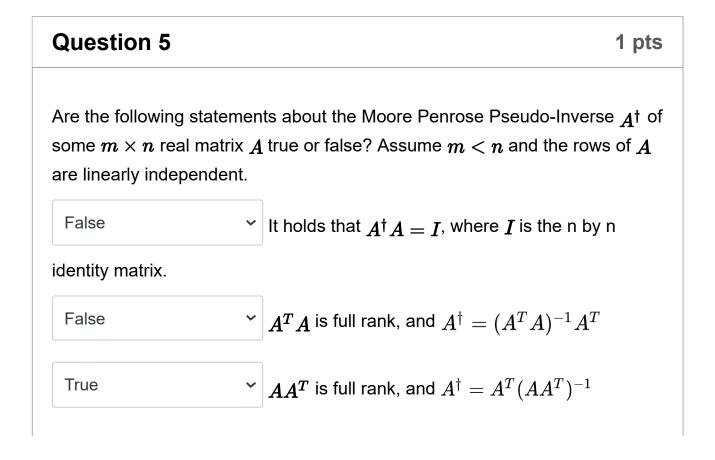

#### 1 pts

Determine whether the following plots of principle components are possible. All data points are two dimensional and are captured by blue dots in the plots. PCA is run on the datasets and the the principle components are presented as black arrows. "PC1" represents the first principle component and "PC2" represents the second principle component.

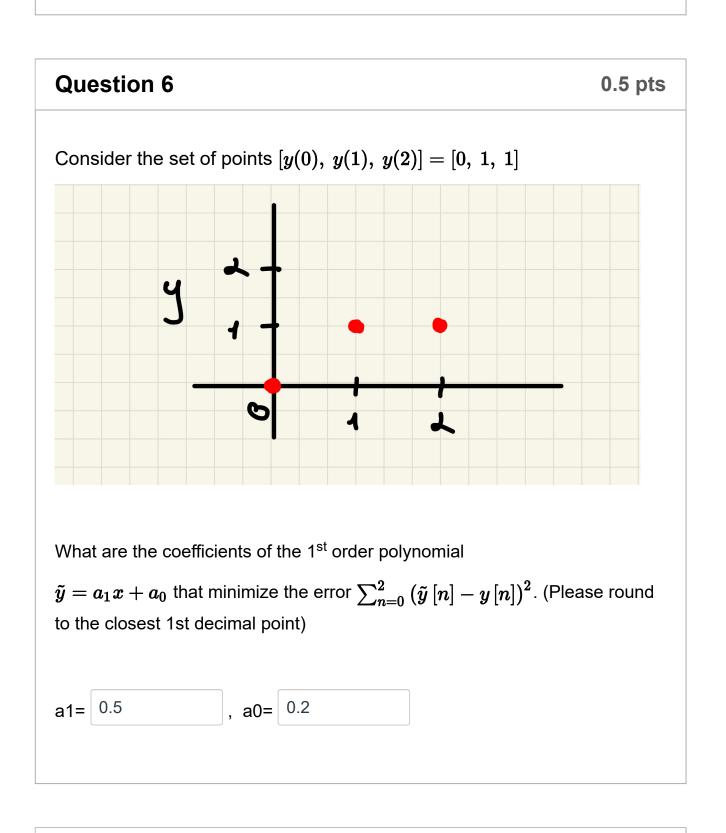

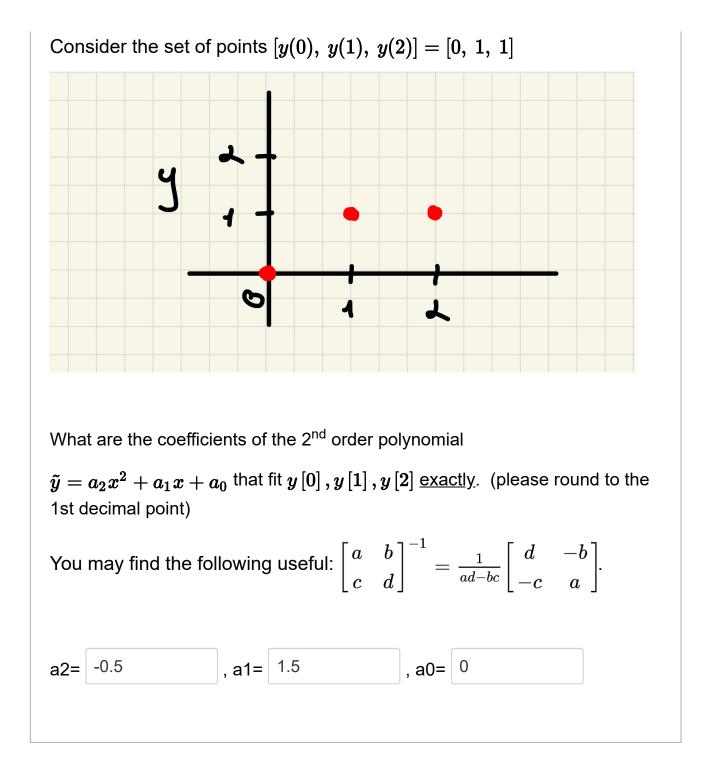

True

×

**Question 7** 

## Question 8 0.5 pts Consider the set of points [y(0), y(1), y(2)] = [0, 1, 1]
