## Lab \#1

1. Install and play with $\mathrm{CVX}^{1}$. Be sure to learn how to solve a least-squares problem.
2. Reformulating constaints in cvx. Each of the following cvx code fragments describes a convex constraint on the scalar variables $\mathrm{x}, \mathrm{y}$, and z , but violates the cvx rule set, and so is invalid. Briefly explain why each fragment is invalid. Then, rewrite each one in an equivalent form that conforms to the cvx rule set. In your reformulations, you can use linear equality and inequality constraints, and inequalities constructed using cvx functions. You can also introduce additional variables, or use LMIs. Be sure to explain (briefly) why your reformulation is equivalent to the original constraint, if it is not obvious.

Check your reformulations by creating a small problem that includes these constraints, and solving it using cvx. Your test problem doesn't have to be feasible; it's enough to verify that cvx processes your constraints without error.
Remark. This looks like a problem about 'how to use cvx software', or 'tricks for using cvx'. But it really checks whether you understand the various composition rules, convex analysis, and constraint reformulation rules.
(a) $\operatorname{norm}([\mathrm{x}+2 * \mathrm{y}, \mathrm{x}-\mathrm{y}])==0$
(b) square ( square ( $\mathrm{x}+\mathrm{y}$ ) ) <= $\mathrm{x}-\mathrm{y}$
(c) $1 / \mathrm{x}+1 / \mathrm{y}<=1$; $\mathrm{x}>=0 ; \mathrm{y}>=0$
(d) $\operatorname{norm}([\max (\mathrm{x}, 1), \max (\mathrm{y}, 2)])<=3 * \mathrm{x}+\mathrm{y}$
(e) $x * y>=1 ; x>=0 ; y>=0$
(f) $(\mathrm{x}+\mathrm{y})^{\wedge} 2 / \operatorname{sqrt}(\mathrm{y})<=\mathrm{x}-\mathrm{y}+5$
(g) $x^{\wedge} 3+y^{\wedge} 3<=1 ; x>=0 ; y>=0$
(h) $x+z<=1+\operatorname{sqrt}\left(x * y-z^{\wedge} 2\right) ; x>=0 ; y>=0$
