

UC Berkeley

## EE C245 - ME C218 Introduction to MEMS Design Fall 2010

Prof. Clark T.-C. Nguyen

Dept. of Electrical Engineering & Computer Sciences  
University of California at Berkeley  
Berkeley, CA 94720

Lecture Module 6: Bulk Micromachining

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    1

UC Berkeley

## Lecture Outline

- Reading: Senturia Chpt. 3, Jaeger Chpt. 11, Handouts: "Bulk Micromachining of Silicon"
- Lecture Topics:
  - ↪ Bulk Micromachining
  - ↪ Anisotropic Etching of Silicon
  - ↪ Boron-Doped Etch Stop
  - ↪ Electrochemical Etch Stop
  - ↪ Isotropic Etching of Silicon
  - ↪ Deep Reactive Ion Etching (DRIE)

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    2

UC Berkeley

## Bulk Micromachining

- Basically, etching the substrate (usually silicon) to achieve microstructures
- Etching modes:
  - ↪ Isotropic vs. anisotropic
  - ↪ Reaction-limited
    - Etch rate dep. on temp.
  - ↪ Diffusion-limited
    - Etch rate dep. on mixing
    - Also dependent on layout & geometry, i.e., on loading
- Choose etch mode based on
  - ↪ Desired shape
  - ↪ Etch depth and uniformity
  - ↪ Surface roughness (e.g., sidewall roughness after etching)
  - ↪ Process compatibility (w/ existing layers)
  - ↪ Safety, cost, availability, environmental impact

	Wet etch	Plasma (dry) etch
Isotropic		
Anisotropic		

slowest step controls rate of reaction

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    3

UC Berkeley

## Mechanical Properties of Silicon

- Crystalline silicon is a hard and brittle material that deforms elastically until it reaches its yield strength, at which point it breaks.
  - ↪ Tensile yield strength = 7 GPa (~1500 lb suspended from 1 mm<sup>2</sup>)
  - ↪ Young's Modulus near that of stainless steel
  - ↪ {100} = 130 GPa; {110} = 169 GPa; {111} = 188 GPa
  - ↪ Mechanical properties uniform, no intrinsic stress
  - ↪ Mechanical integrity up to 500°C
  - ↪ Good thermal conductor
  - ↪ Low thermal expansion coefficient
  - ↪ High piezoresistivity

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    4

### Anisotropic Etching of Silicon

UC Berkeley

- Etching of Si w/ KOH
  - $\text{Si} + 2\text{OH}^- \rightarrow \text{Si}(\text{OH})_2^{2-} + 4e^-$
  - $4\text{H}_2\text{O} + 4e^- \rightarrow 4(\text{OH})^- + 2\text{H}_2$
- Crystal orientation dependent etch rates
  - {110}:{100}:{111}=600:400:1
  - {100} and {110} have 2 bonds below the surface & 2 dangling bonds that can react
  - {111} plane has three of its bonds below the surface & only one dangling bond to react → much slower E.R.
  - {111} forms protective oxide
  - {111} smoother than other crystal planes → good for optical MEMS (mirrors)

Self-limiting etches

### Anisotropic Etching of Silicon

UC Berkeley

- Deposit nitride:
  - Target = 100nm
  - 22 min. LPCVD @800°C
- Lithography to define areas of silicon to be etched
- Etch/pattern nitride mask
  - RIE using  $\text{SF}_6$
  - Remove PR in PRS2000
- Etch the silicon
  - Use 1:2 KOH:H<sub>2</sub>O (wt.), stirred bath @ 80°C
  - Etch Rates:
    - (100) Si → 1.4 μm/min
    - Si<sub>3</sub>N<sub>4</sub> → ~ 0 nm/min
    - SiO<sub>2</sub> → 1-10 nm/min
    - Photoresist, Al → fast
- Micromasking by H<sub>2</sub> bubbles leads to roughness
  - Stir well to displace bubbles
  - Can also use oxidizer for (111) surfaces
  - Or surfactant additives to suppress bubble formation

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    6

### Silicon Wafers

UC Berkeley

**Miller Indices (h k l):**

- Planes
  - Reciprocal of plane intercepts with axes
  - e.g., for (110), intercepts: (x,y,z) = (1,1,∞); reciprocals: (1,1,0) → (110)
  - (unique), {family}
- Directions
  - One endpoint of vector @ origin
  - [unique], <family>

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    8

### Determining Angles Between Planes

UC Berkeley

- The angle between vectors  $[abc]$  and  $[xyz]$  is given by:
 
$$ax + by + cz = |(a, b, c)| \cdot |(x, y, z)| \cdot \cos \theta$$

$$\theta_{(a,b,c),(x,y,z)} = \cos^{-1} \left[ \frac{ax + by + cz}{|(a, b, c)| \cdot |(x, y, z)|} \right]$$
- For  $\{100\}$  and  $\{110\} \rightarrow 45^\circ$
- For  $\{100\}$  and  $\{111\} \rightarrow 54.74^\circ$
- For  $\{110\}$  and  $\{111\} \rightarrow 35.26^\circ, 90^\circ, \text{ and } 144.74^\circ$

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    9

### Silicon Crystal Origami

UC Berkeley

- Silicon fold-up cube
- Adapted from Profs. Kris Pister and Jack Judy
- Print onto transparency
- Assemble inside out
- Visualize crystal plane orientations, intersections, and directions

[Judy, UCLA]

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    10

### Undercutting Via Anisotropic Si Etching

UC Berkeley

- Concave corners bounded by  $\{111\}$  are not attacked
- ... but convex corners bounded by  $\{111\}$  are attacked
  - Two  $\{111\}$  planes intersecting now present two dangling bonds  $\rightarrow$  no longer have just one dangling bond  $\rightarrow$  etch rate fast
  - Result: can undercut regions around convex corners

Concave corner

Convex corner

Suspended Beam

[Ristic]

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    11

### Corner Compensation

UC Berkeley

- Protect corners with "compensation" areas in layout
- Below: Mesa array for self-assembly structures [Smith 1995]

Mask pattern

Mask pattern

Shaded regions are the desired result

Groove  $W_1$

$2^{\circ}d$

$d = \text{Depth of groove}$

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    12

**Other Anisotropic Silicon Etchants**

- TMAH, Tetramethyl ammonium hydroxide, 10-40 wt.% (90°C)
  - ↳ Etch rate (100) = 0.5-1.5 μm/min
  - ↳ Al safe, IC compatible
  - ↳ Etch ratio (100)/(111) = 10-35
  - ↳ Etch masks: SiO<sub>2</sub>, Si<sub>3</sub>N<sub>4</sub> ~ 0.05-0.25 nm/min
  - ↳ Boron doped etch stop, up to 40× slower
- EDP (115°C)
  - ↳ Carcinogenic, corrosive
  - ↳ Etch rate (100) = 0.75 μm/min
  - ↳ Al may be etched
  - ↳ R(100) < R(110) < R(111)
  - ↳ Etch ratio (100)/(111) = 35
  - ↳ Etch masks: SiO<sub>2</sub> ~ 0.2 nm/min, Si<sub>3</sub>N<sub>4</sub> ~ 0.1 nm/min
  - ↳ Boron doped etch stop, 50× slower

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    13

**Boron-Doped Etch Stop**

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    14

**Boron-Doped Etch Stop**

- Control etch depth precisely with boron doping (p++)
  - ↳ [B] > 10<sup>20</sup> cm<sup>-3</sup> reduces KOH etch rate by 20-100×
  - ↳ Can use gaseous or solid boron diffusion
  - ↳ Recall etch chemistry:  
 $Si + 2OH^- \rightarrow Si(OH)_2^{2+} + 4e^-$   
 $4H_2O + 4e^- \rightarrow 4(OH)^- + 2H_2$
  - ↳ At high dopant levels, injected electrons recombine with holes in valence band and are unavailable for reactions to give OH<sup>-</sup>
- **Result:**
  - ↳ Beams, suspended films
  - ↳ 1-20 μm layers possible

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    15

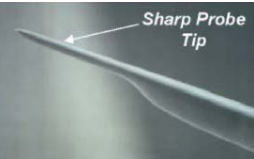

**Ex: Micronozzle**

- Micronozzle using anisotropic etch-based fabrication
- Used for inkjet printer heads

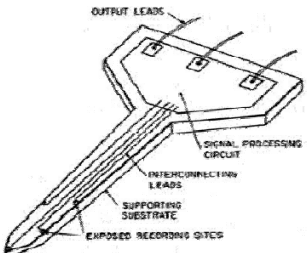

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    16

**Ex: Microneedle**

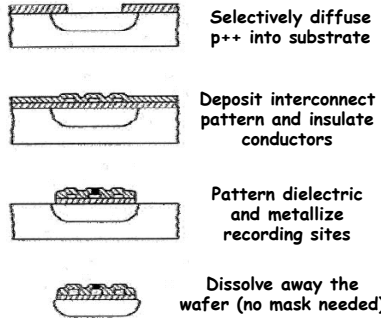

- **Below: micro-neurostimulator**  
Used to access central nervous system tissue (e.g., brain) and record electrical signals on a cellular scale
- Wise Group, Univ. of Michigan

Sharp Probe Tip

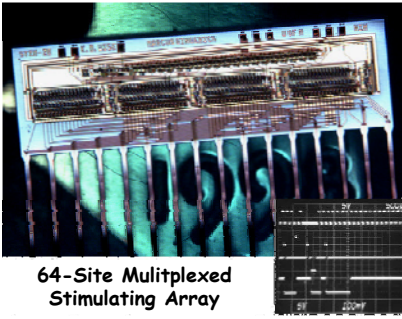

Multi-Channel Recording Array Structure

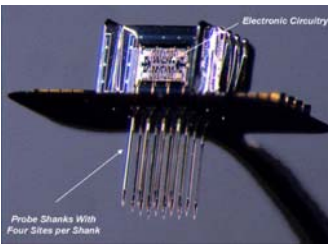

- Selectively diffuse p++ into substrate
- Deposit interconnect pattern and insulate conductors
- Pattern dielectric and metallize recording sites
- Dissolve away the wafer (no mask needed)

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 17

**Ex: Microneedles (cont.)**

64-Site Multiplexed Stimulating Array

Electronic Circuitry

Probe Shanks With Four Sites per Shank

[Wise, U. of Michigan]

- Micromachined with on-chip CMOS electronics
- Both stimulation and recording modes
- 400  $\mu\text{m}$  site separations, extendable to 3D arrays
- Could be key to neural prosthesis systems focusing on the central nervous system

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 18

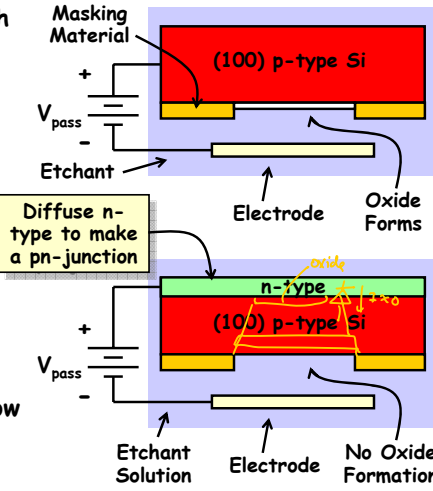

**Electrochemical Etch Stop**

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 19

**Electrochemical Etch Stop**

- When silicon is biased with a sufficiently large anodic potential relative to the etchant  $\rightarrow$  get oxidation (i.e., electrochemical passivation), which then prevents etching
- For passivation to occur, current flow is required
- If current flow can be prevented  $\rightarrow$  no oxide growth, and etching can proceed

Can prevent current flow by adding a reverse-biased diode structure

Masking Material

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 20

### Electrochemical Etch Stop

UC Berkeley

- Electrochemical etch stop
  - n-type epitaxial layer grown on p-type wafer forms p-n junction diode
  - $V_p > V_n \rightarrow$  electrical conduction (current flow)
  - $V_p < V_n \rightarrow$  reverse bias current (very little current flow)
- Passivation potential: potential at which thin  $\text{SiO}_2$  film forms
  - different for p-Si and n-Si, but basically need the Si to be the anode in an electrolytic setup
- Setup:
  - p-n diode in reverse bias
  - p-substrate floating  $\rightarrow$  etched
  - n-layer above passivation potential  $\rightarrow$  not etched

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    21

### Electrochemical Etching of CMOS

UC Berkeley

- N-type Si well with circuits suspended f/  $\text{SiO}_2$  support beam
- Thermally and electrically isolated
- If use TMAH etchant, Al bond pads safe

[Reay, et al. (1994)]  
[Kovacs Group, Stanford]

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    22

### Ex: Bulk Micromachined Pressure Sensors

UC Berkeley

- Piezoresistivity: change in electrical resistance due to mechanical stress
- In response to pressure load on thin Si film, piezoresistive elements change resistance
- Membrane deflection  $< 1 \mu\text{m}$

[Maluf]

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    23

### Ex: Pressure Sensors

UC Berkeley

- Below: catheter tip pressure sensor [Lucas NovaSensor]
  - Only  $150 \times 400 \times 900 \mu\text{m}^3$

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    24

### Deep Reactive-Ion Etching (DRIE)

**The Bosch process:**

- Inductively-coupled plasma
- Etch Rate: 1.5-4  $\mu\text{m}/\text{min}$
- Two main cycles in the etch:
  - Etch cycle** (5-15 s):  $\text{SF}_6$  ( $\text{SF}_x^+$ ) etches Si
  - Deposition cycle** (5-15 s):  $\text{C}_4\text{F}_8$  deposits fluorocarbon protective polymer ( $\text{CF}_2^-$ )<sub>n</sub>
- Etch mask selectivity:
  - $\text{SiO}_2 \sim 200:1$
  - Photoresist  $\sim 100:1$
- Issue:** finite sidewall roughness
  - scalloping  $< 50 \text{ nm}$
- Sidewall angle:  $90^\circ \pm 2^\circ$

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 25

### DRIE Issues: Etch Rate Variance

- Etch rate is diffusion-limited and drops for narrow trenches
  - Adjust mask layout to eliminate large disparities
  - Adjust process parameters (slow down the etch rate to that governed by the slowest feature)

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 26

### DRIE Issues: "Footing"

- Etch depth precision
  - Etch stop: buried layer of  $\text{SiO}_2$
  - Due to 200:1 selectivity, the (vertical) etch practically just stops when it reaches  $\text{SiO}_2$
- Problem:** Lateral undercut at Si/ $\text{SiO}_2$  interface  $\rightarrow$  "footing"
  - Caused by charge accumulation at the insulator

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 27

### Recipe-Based Suppression of "Footing"

- Use **higher process pressure** to reduce ion charging [Nozawa]
  - High operating pressure  $\rightarrow$  concentration of (-) ions increases and can neutralize (+) surface charge
  - Issue:** must introduce as a separate recipe when the etch reaches the Si-insulator interface, so must be able to very accurately predict the time needed for etching
- Adjust etch recipe** to reduce overetching [Schmidt]
  - Change  $\text{C}_4\text{F}_8$  flow rate, pressure, etc., to enhance passivation and reduce overetching
  - Issue:** Difficult to simultaneously control footing in a narrow trench and prevent grass in wide trenches
- Use **lower frequency plasma** to avoid surface charging [Morioka]
  - Low frequency  $\rightarrow$  more ions with low directionality and kinetic energy  $\rightarrow$  neutralizes (-) potential barrier at trench entrance
  - Allows  $e^-$ 's to reach the trench base and neutralize (+) charge  $\rightarrow$  maintain charge balance inside the trench

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 28

### Metal Interlayer to Prevent "Footing"

Pre-defined metal interlayer grounded to substrate supplies e's to neutralize (+) charge and prevent charge accumulation at the Si-insulator interface

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 29

### Footing Prevention (cont.)

- Below: DRIE footing over an oxide stop layer
- Right: efficacy of the metal interlayer footing prevention approach

[Kim, Stanford]

[Kim, Seoul Nat. Univ.]

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 30

### DRIE Examples

High aspect-ratio gear

Tunable Capacitor [Yao, Rockwell]

Microgripper [Keller, MEMS Precision Instruments]

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 31

### Vapor Phase Etching of Silicon

- Vapor phase Xenon Difluoride ( $\text{XeF}_2$ )  

$$2\text{XeF}_{2(g)} + \text{Si}_{(s)} \rightarrow 2\text{Xe}_{(g)} + \text{SiF}_{4(g)}$$
- Set-up:
  - Xe sublimates at room T
  - Closed chamber, 1-4 Torr
  - Pulsed to control exothermic heat of reaction
- Etch rate: 1-3  $\mu\text{m}/\text{min}$ , isotropic
- Etch masks: photoresist,  $\text{SiO}_2$ ,  $\text{Si}_3\text{N}_4$ , Al, other metals
- Issues:
  - Etched surfaces have granular structure, 10  $\mu\text{m}$  roughness
  - Hazard:  $\text{XeF}_2$  reacts with  $\text{H}_2\text{O}$  in air to form Xe and HF

Xactix  $\text{XeF}_2$  Etcher

Inductor w/ no substrate [Pister]

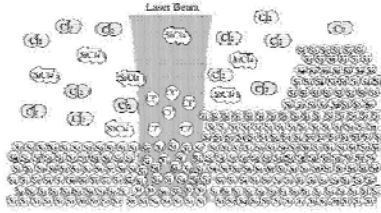

EE C245: Introduction to MEMS Design LecM 6 C. Nguyen 9/28/07 32

### Laser-Assisted Chemical Etching

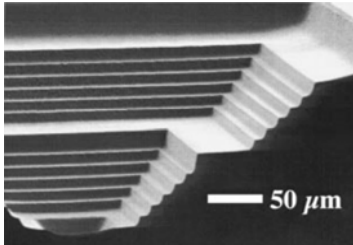

UC Berkeley

- Laser creates Cl radicals from  $\text{Cl}_2 \rightarrow$  reaction forms  $\text{SiCl}_2$
- Etch rate:  $100,000 \mu\text{m}^3/\text{s}$ 
  - Takes 3 min. to etch  $500 \times 500 \times 125 \mu\text{m}^3$  trench
- Surface roughness: 30 nm rms
- Serial process: patterned directly from CAD file

At right:

- Laser assisted etching of a  $500 \times 500 \mu\text{m}^2$  terraced silicon well
- Each step is  $6 \mu\text{m}$ -deep

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    33

### Wafer Bonding

UC Berkeley

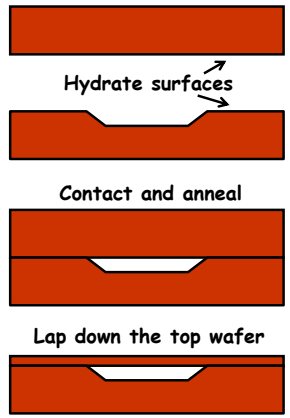

Wafer Bonding

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    34

### Fusion Bonding

UC Berkeley

- Two ultra-smooth ( $<1 \text{ nm}$  roughness) wafers are bonded without adhesives or applied external forces
- Procedure:
  - Prepare surfaces: must be smooth and particle-free
    - Clean & hydrate:  $\text{O}_2$  plasma, hydration, or HF dip
  - When wafers are brought in contact at room temperature, get hydrogen bonding and/or van der Waals forces to hold them together
  - Anneal at  $600\text{-}1200^\circ\text{C}$  to bring the bond to full strength
- Result: a bond as strong as the silicon itself!

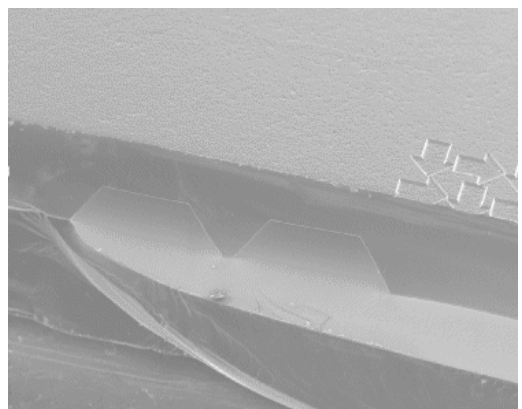

Works for Si-to-Si bonding and Si-to-SiO<sub>2</sub> bonding

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    35

### Fusion Bonding Example

UC Berkeley

- Below: capacitive pressure sensor w/ fusion-bonded features

[Univ. of Southampton]

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    36

### Anodic Bonding

UC Berkeley

- Bonds an electron conducting material (e.g., Si) to an ion conducting material (e.g., sodium glass = Pyrex)
- Procedure/Mechanism:
  - Press Si and glass together
  - Elevate temperature: 180-500°C ✓
  - Apply (+) voltage to Si: 200-1500V
    - (+) voltage repels Na<sup>+</sup> ions from the glass surface
    - Get net (-) charge at glass surface
    - Attractive force between (+) Si and (-) glass → intimate contact allows fusing at elevated temp.
  - Current drops to zero when bonding is complete

The schematic shows a Silicon (Si) wafer on top of a Pyrex glass wafer, both on a hot plate. A positive voltage is applied to the Si, and a negative voltage is applied to the glass. Red arrows indicate Na<sup>+</sup> ions moving away from the glass surface. Below the schematic are four graphs: Temperature (rises to 430°C), Pressure (applied during bonding), Voltage (applied to Si), and Current (spikes during bonding and then drops to zero).

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    37

### Anodic Bonding (cont.)

UC Berkeley

- Advantage:** high pressure of electrostatic attraction smoothes out defects
- Below:** 100 mm wafers, Pyrex glass 500 μm-thick, 430°C, 800V, N<sub>2</sub> @ 1000 mbar

The four images show the bonding process on a circular wafer: 1. after 5 sec (Only center bond pin active), 2. after 20 sec (All bond pins active), 3. after 2.5 min (Bond front spreads), 4. after 8 min (Bond 98% completed).

EE C245: Introduction to MEMS Design    LecM 6    C. Nguyen    9/28/07    38
